## LAB REPORT on

# Computer Networks

*Submitted by*

**J S MEGHANA (1BM18CS039)**

*in partial fulfillment for the award of the degree of*

**BACHELOR OF ENGINEERING**

*in*

**COMPUTER SCIENCE AND ENGINEERING**

**B.M.S. COLLEGE OF ENGINEERING**

(Autonomous Institution under VTU)

**BENGALURU-560019**

**JUN-2023 to SEP-2023**

**B. M. S. College of Engineering,  
Bull Temple Road, Bangalore 560019**  
(Affiliated To Visvesvaraya Technological University, Belgaum)  
**Department of Computer Science and Engineering**

### **CERTIFICATE**

This is to certify that the Lab work entitled “**LAB COURSE Computer Networks**” carried out by **J S MEGHANA (1BM18CS039)**, who is bonafide student of **B. M. S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2023. The Lab report has been approved as it satisfies the academic requirements in respect of a **Computer Networks - (22CS4PCCON)** work prescribed for the said degree.

Dr Latha N.R.  
Assistant Professor

Department of CSE  
BMSCE, Bengaluru

# Index

<b>Sl. No.</b>	<b>Date</b>	<b>Experiment Title</b>	<b>Page No.</b>
1.	15/06/23	Create a topology and simulate sending a simple PDU from source to destination using hub and switch as connecting devices and demonstrate ping message.	1-7
2.	22/06/23	Configure IP address to routers in packet tracer. Explore the following messages: ping responses, destination unreachable, request timed out, reply.	8-12
3.	13/07/23	Configure default route, static route to the Router.	13-38
4.	13/07/23	Configure DHCP within a LAN and outside LAN.	39-51
5.	20/07/23	Configure RIP routing Protocol in Routers.	52-65
6.	20/07/23	Configure Web Server, DNS within a LAN.	66-71
7.	27/07/23	Configure OSPF routing protocol.	72-82
8.	27/07/23	To construct simple LAN and understand the concept and operation of Address Resolution Protocol (ARP).	83-90
9.	03/08/23	To construct a VLAN and make the PC's communicate among a VLAN.	91-103
10.	10/08/23	Demonstrate the TTL/ Life of a Packet.	104-110
11.	10/08/23	To construct a WLAN and make the nodes communicate wirelessly.	111-121
12.	10/08/23	To understand the operation of TELNET by accessing the router in server room from a PC in IT office.	122-128
13.	17/08/23	Write a program for error detecting code using CRCCCITT (16-bits).	129-136
14.	17/08/23	Write a program for congestion control using Leaky bucket algorithm.	137-143
15.	24/08/23	Using TCP/IP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.	144-147
16.	25/08/23	Using UDP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.	148-152
17.	31/08/23	Tool Exploration -Wireshark	153-155

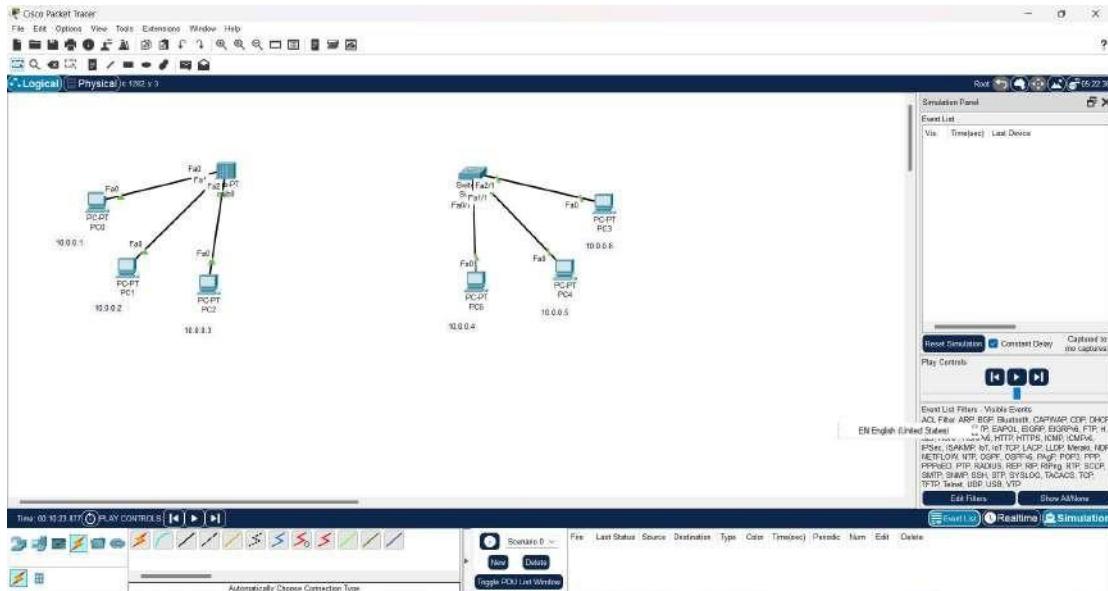

# Experiment No. 1

## Cycle 1

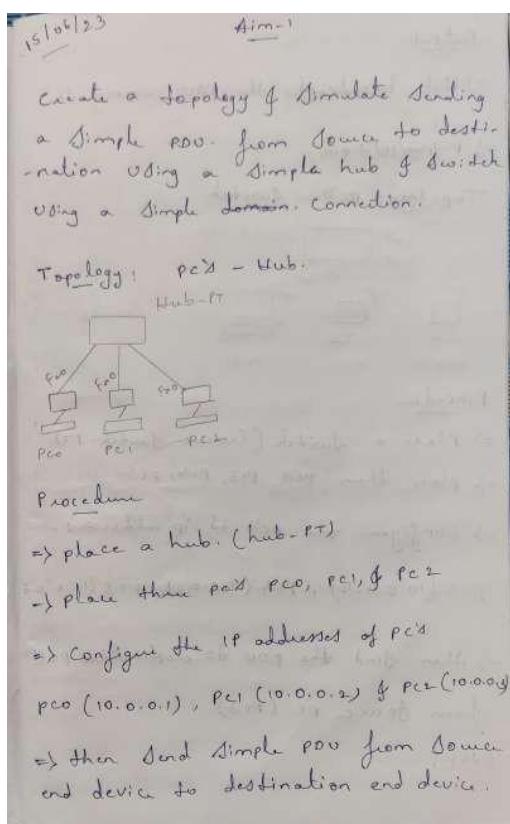

### Aim-1

1. Create a topology and simulate sending a simple PDU from source to destination using hub and switch as connecting devices and demonstrate ping message.

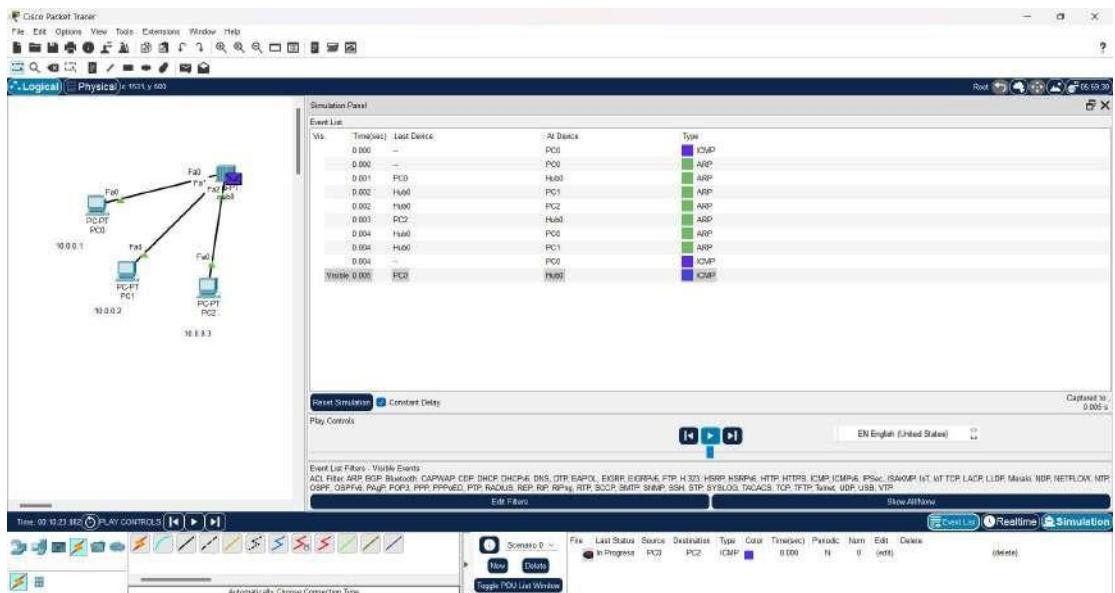

**Topology:**

**Procedure for Hub:**

## Simulation:

Sending PDU from source device (pc0) to destination device (pc2).

## Ping Response:

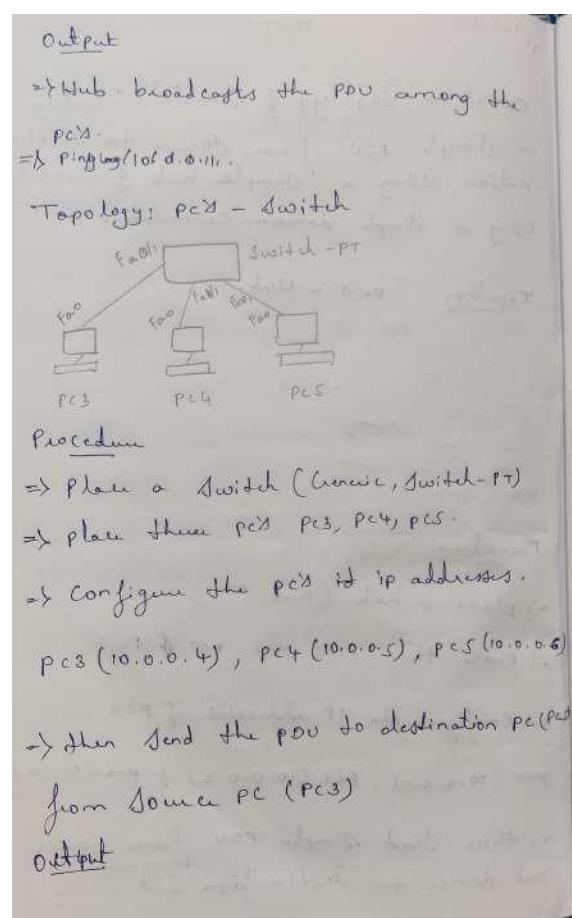

```
C:\>ping 10.0.0.3

Pinging 10.0.0.3 with 32 bytes of data:
Reply from 10.0.0.3: bytes=32 time=4ms TTL=128

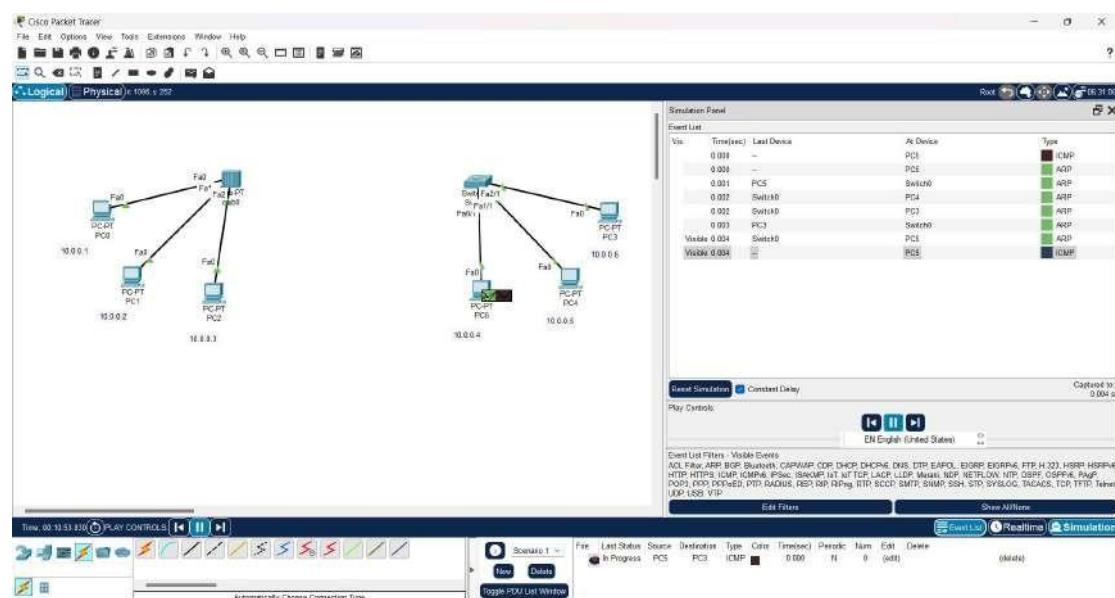

Ping statistics for 10.0.0.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 4ms, Maximum = 4ms, Average = 4ms
```

Ping response from pc0 to pc2.

## Procedure for Switch:

## Simulation:

Sending PDU from source device (pc5) to destination device (pc3).

## Ping Response:

The screenshot shows a Cisco Packet Tracer window titled "PC5". The "Command Prompt" tab is selected. The terminal window displays the output of a ping command from PC5 to PC3. The output is as follows:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 10.0.0.6

Pinging 10.0.0.6 with 32 bytes of data:

Reply from 10.0.0.6: bytes=32 time=4ms TTL=128

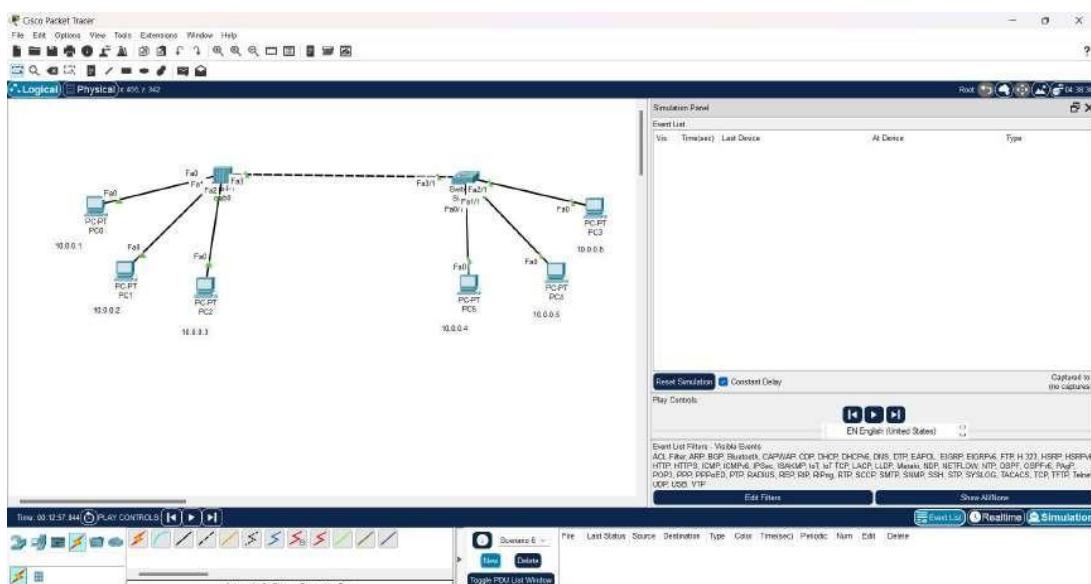

Ping statistics for 10.0.0.6:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 4ms, Maximum = 4ms, Average = 4ms

C:\>|
```

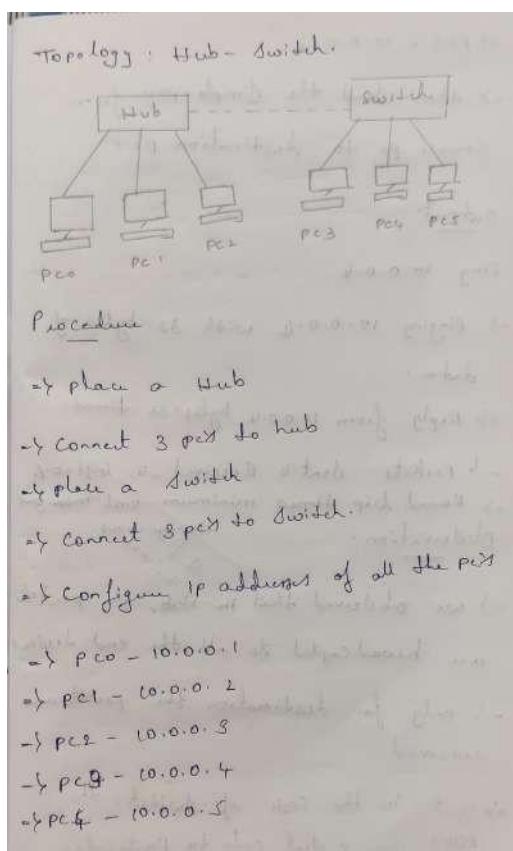

The status bar at the bottom right of the terminal window shows "EN English".

Ping response from pc5 to pc3.

## Topology (Hub-Switch):

## Procedure (Hub-Switch):

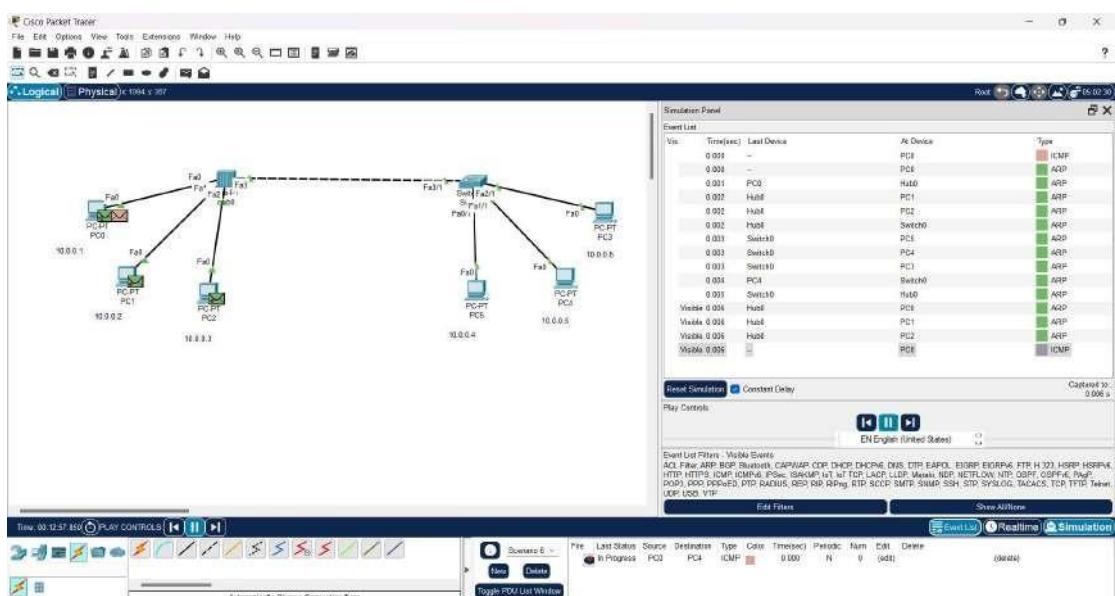

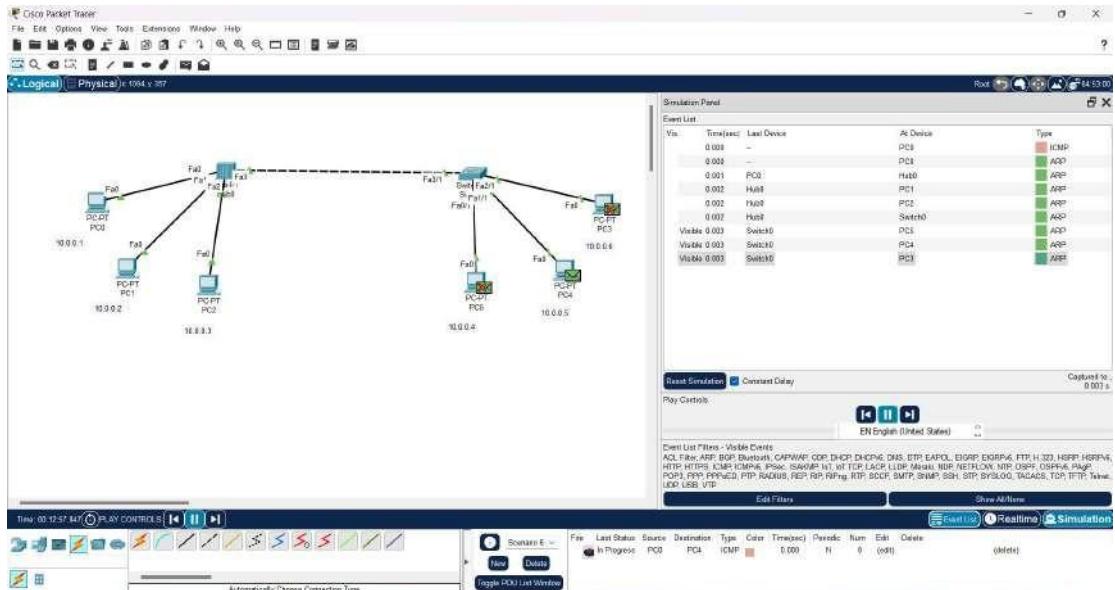

-> Then send the simple PDU from source pc to destination pc.

Output

Ping 10.0.0.4

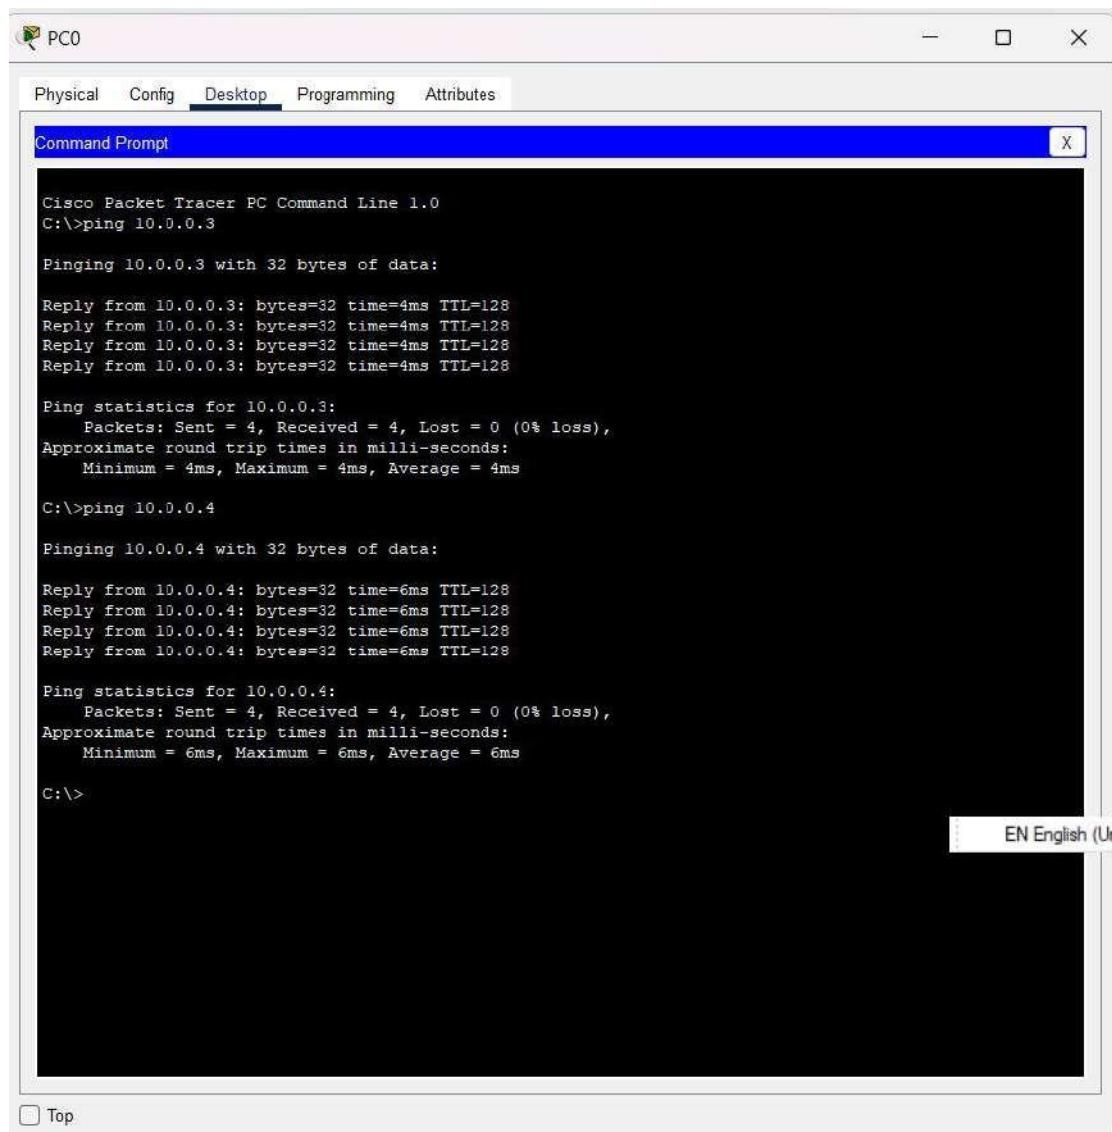

- > Pinging 10.0.0.4 with 32 bytes of data.
- > Reply from 10.0.0.4 bytes: 32 times.
- > Packets Sent/4 Received = 4, lost=0%.
- > Round trip times minimum 0ms, maximum 0ms, average 0ms.
- > we observed that in Hub, the packets are broadcasted to all the end devices
- > only for destination the packets are received
- > But in the case of switch, the PDUs are sent only to particular destination.

## Simulation:

Sending PDU from source device (pc0) to destination device (pc4).

## Ping Response:

The screenshot shows a window titled "Command Prompt" within the Cisco Packet Tracer interface. The window title bar includes "PC0" and tabs for Physical, Config, Desktop, Programming, and Attributes. The main area displays the following command-line session:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 10.0.0.3

Pinging 10.0.0.3 with 32 bytes of data:

Reply from 10.0.0.3: bytes=32 time=4ms TTL=128

Ping statistics for 10.0.0.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 4ms, Maximum = 4ms, Average = 4ms

C:\>ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time=6ms TTL=128

Ping statistics for 10.0.0.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 6ms, Maximum = 6ms, Average = 6ms

C:\>
```

A status bar at the bottom right indicates "EN English (Un)".

Ping response from pc0 to pc5.

# Experiment No. 2

## Cycle 1

### Aim-2

2. Configure IP address to routers in packet tracer. Explore the following messages: ping responses, destination unreachable, request timed out, reply

Topology:

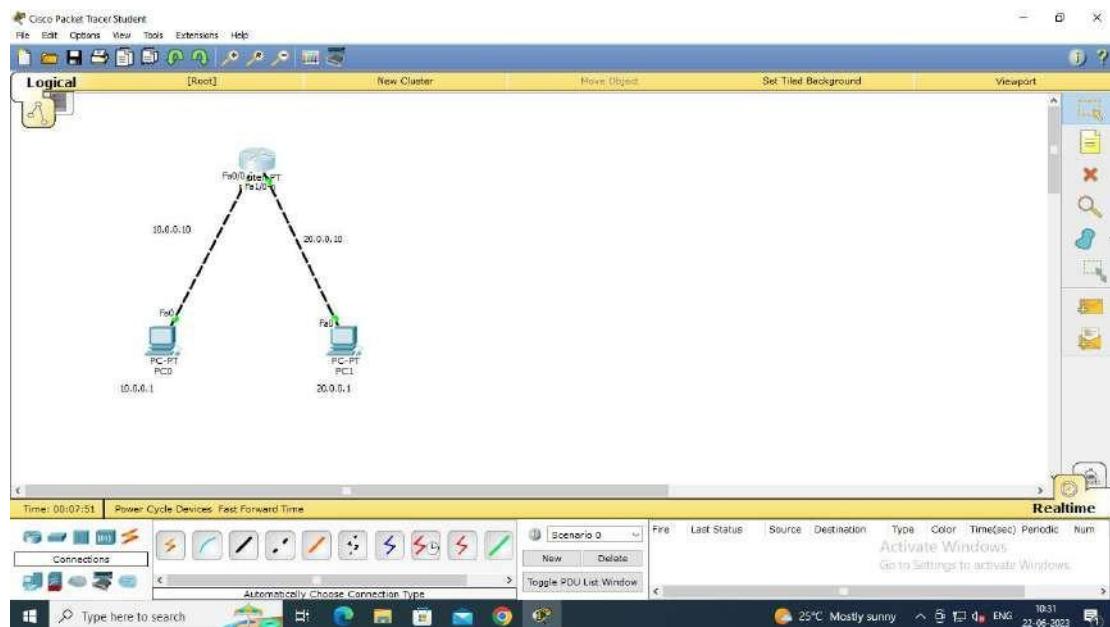

Fig 1: Topology

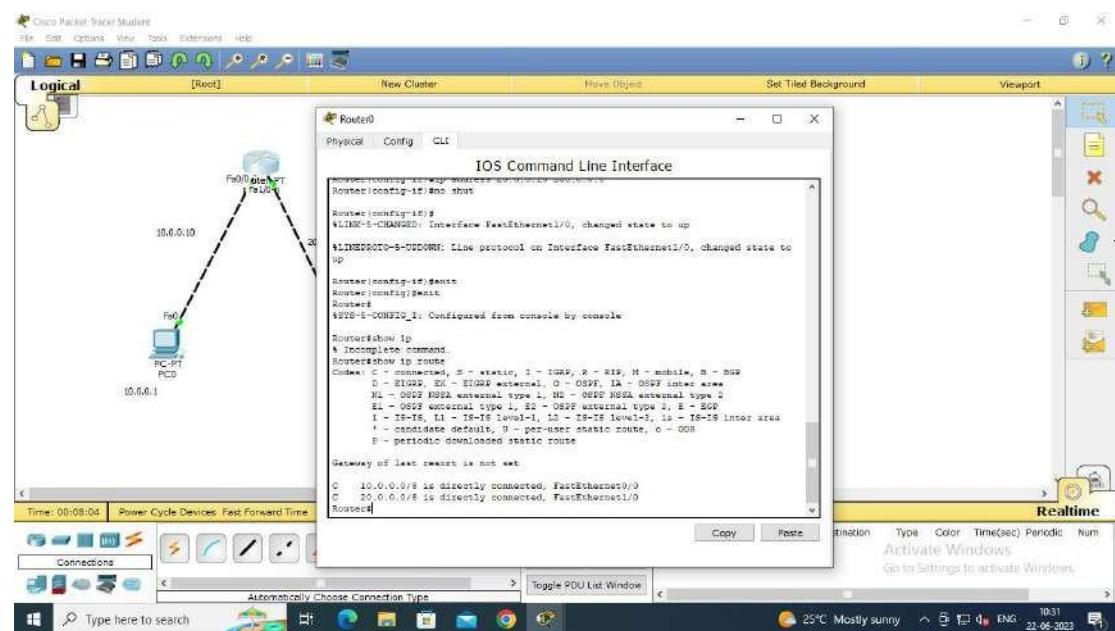

Fig 2: Router showing its connections after configuration

## Procedure and Observation:

Aim - 2

Configure IP address to routes in packet train. Explain the following messages: ping responses, destination unreachable, request timed out, reply.

Topology

Router-0

PC0 (IP: 10.0.0.1)

PC1 (IP: 20.0.0.1)

Switch

Monitor

Procedure:

=> Configuring the IP address of two PCs i.e; PC0 (10.0.0.1) & PC1 (20.0.0.1).

=> Configuring the 1<sup>st</sup> part of route

->n

-> enable

-> config t

-> interface fastethernet 0/0

-> ip address 10.0.0.10 255.0.0.0

-> no shut

-> exit

-> configuring the other port of router

-> interface fastethernet 1/0

-> ip address 20.0.0.10 255.0.0.0

-> no shut

-> exit

-> configuring default gateway for pc's i.e.

Output              PC0 (10.0.0.10)    PC1 (20.0.0.10)

-> Passing ping 20.0.0.1 (message) from

pc0 to pc1.

Response

Pinging 20.0.0.1 with 32 bytes of data:

Request timed out

Reply from 20.0.0.1: bytes = 32 time = 0ms  
TTL = 127

Ping statistics for 20.0.0.1:

Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),

Approximate round trip times in  
milli - seconds:

Minimum = 0ms, Maximum = 0ms,  
Average = 0ms.

- > If try pinging message without setting default gateway the reply would be "destination unreachable".
- > After completely configuring if you get a If tried pinging again the 1st reply would be "request timed out".
- > Then later again if tried will get the successful reply from Source to destination pc's.

Ques  
13/7/23

## Output:

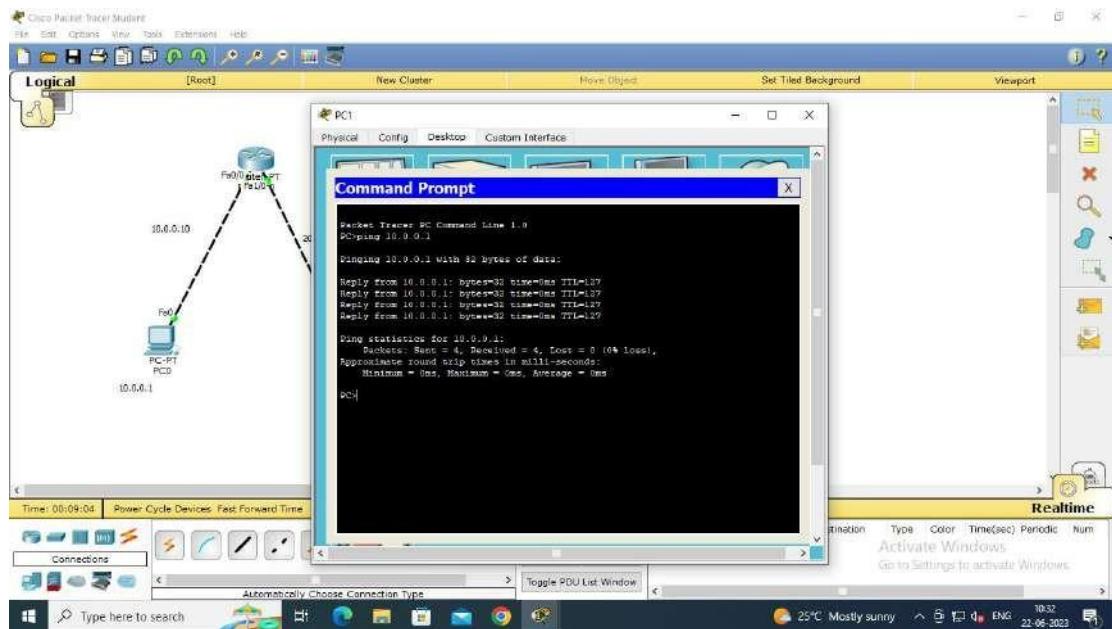

Fig 3: Pinging from pc1 to pc0

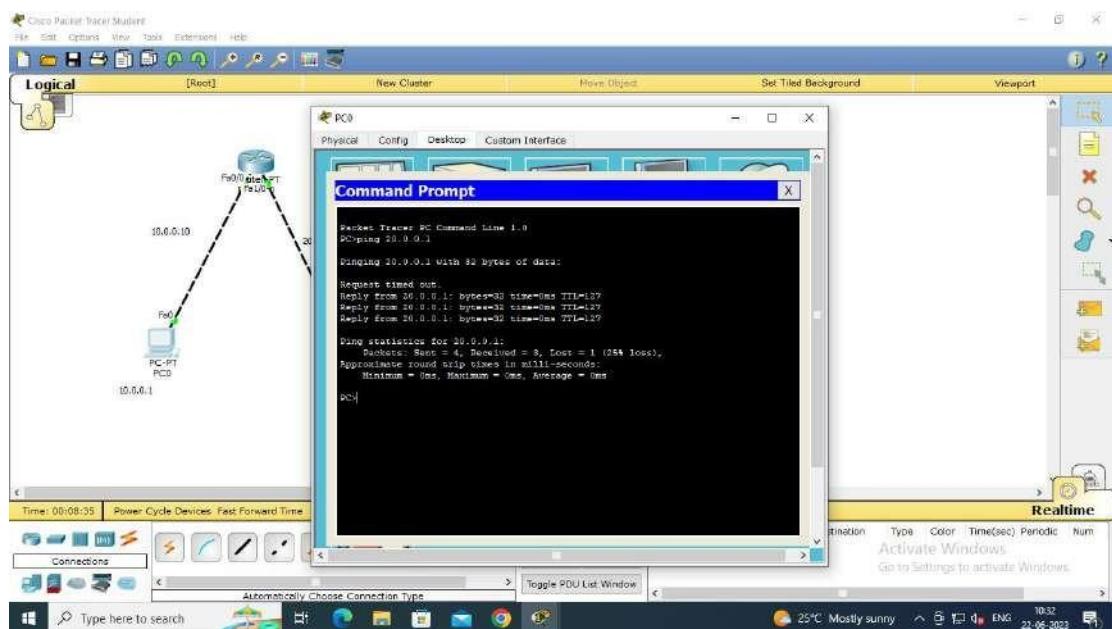

Fig 4: Pinging from pc0 to pc1

# **Experiment No. 3**

## **Cycle 1**

### **Aim-3**

### 3. Configure default route, static route to the Router

Static Route:  
Topology:

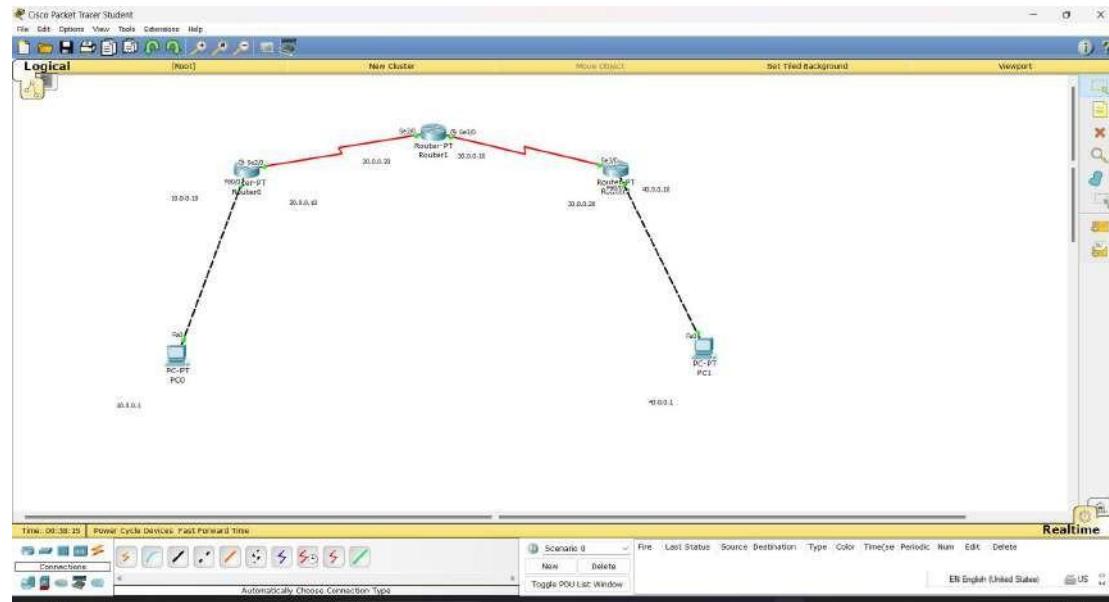

Fig 1: Topology

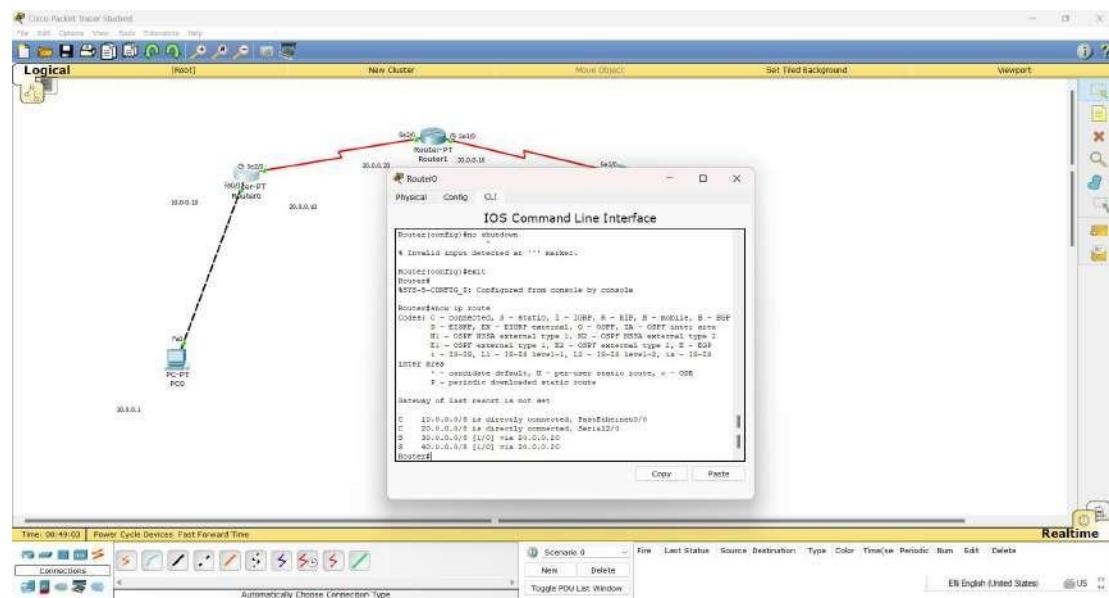

Fig 2: Router0 Connections

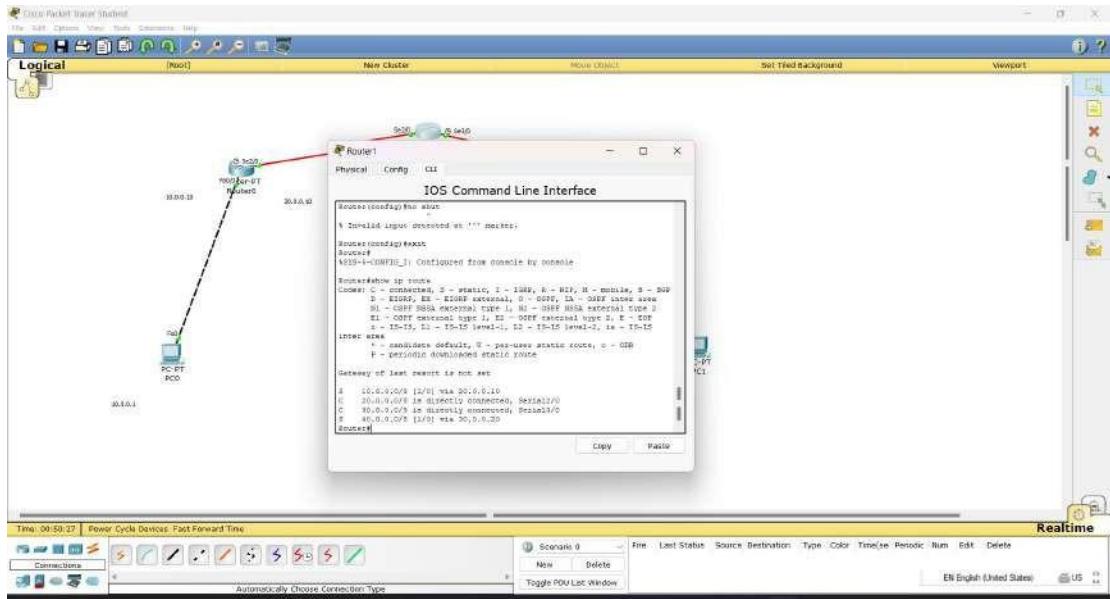

Fig 3: Router1 Connections

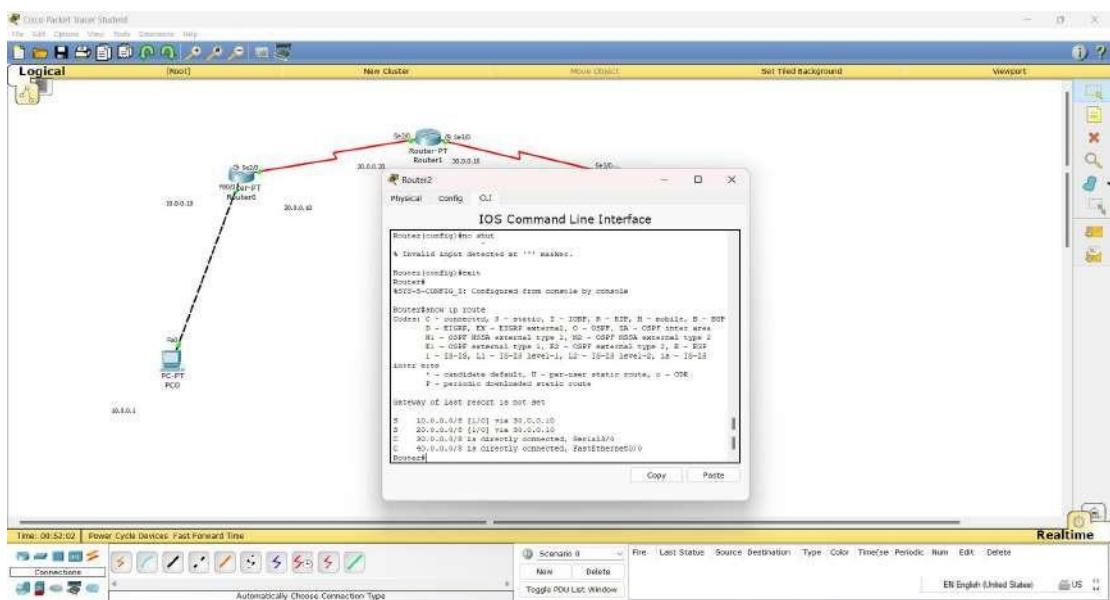

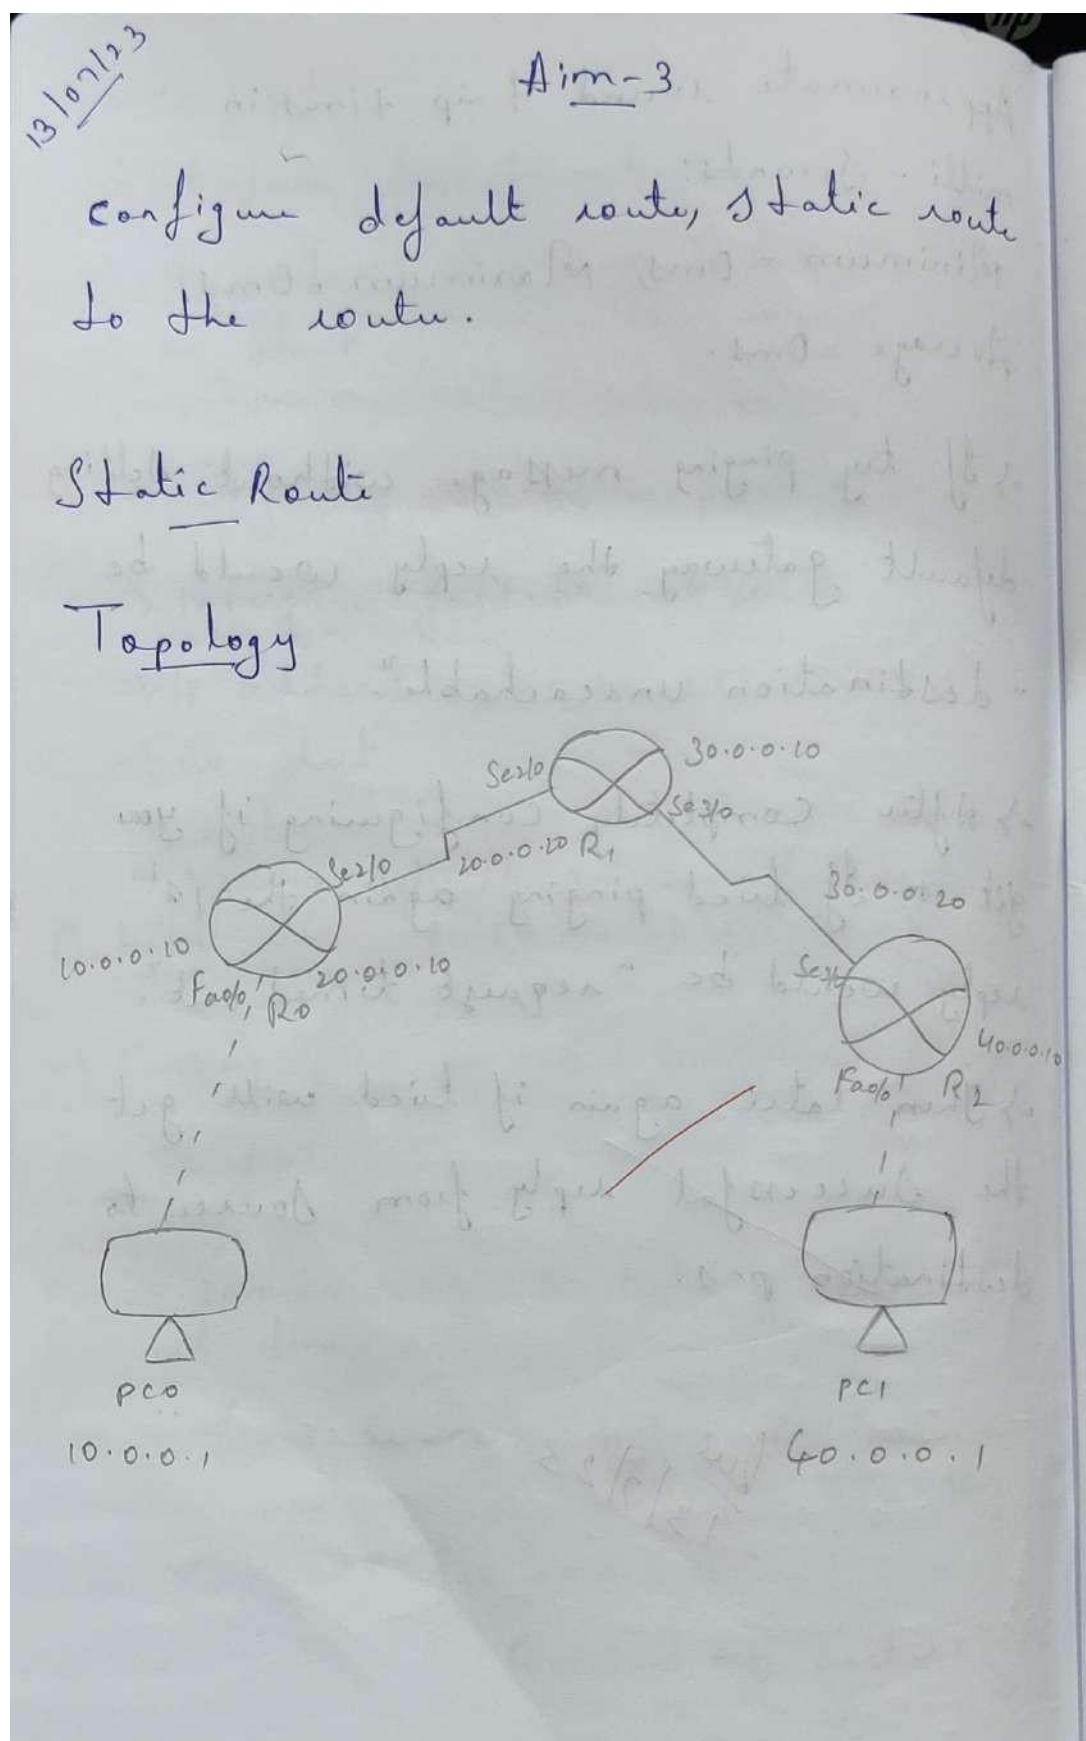

Fig 4: Router2 Connections

Procedure and Observation:

## Procedure

→ Configure the IP addresses of the PCs  
i.e; for PC0 (10.0.0.1) & for PC1 (40.0.0.1).

→ Now configuring the routes.

### Routu 0

→ n

→ enable

→ config t

→ interface fastethernet 0/0

→ IP address 10.0.0.10 255.0.0.0

→ no shut

→ exit

(for Serial).

→ interface serial 2/0

→ IP address 20.0.0.10 255.0.0.0

→ no shut

→ exit

### Router 1

-> n  
-> enable  
-> config t  
-> interface serial 2/0

-> ip address 20.0.0.20 255.0.0.0  
-> no shut down

-> exit

(for serial 3 port)

-> interface serial 3/0

-> ip address 20.30.0.0.10 255.0.0.0

-> no shut

-> exit

### Router 2

-> n

-> enable

-> config

-> ip address interface serial 3/0

-> ip address 30.0.0.20 255.0.0.0  
-> no shut  
-> exit.  
(for fastethernet).  
-> interface fastethernet 0/0  
-> ip address 40.0.0.10 255.0.0.0  
-> no shut  
-> exit.  
-> Now check the connections and see if  
all of them are connected.

Router 0

-> exit  
-> Show ip route

c 10.0.0.0/8 is directly connected, FastEthernet 0/0

c 20.0.0.0/8 is directly connected, Serial 2/0

Router 1

-> exit

-> Show ip route

c 20.0.0.0/8 is directly connected, Serial 2/0

c 30.0.0.0/8 is directly connected, Serial 3/0

### Router 2

=> exit

=> show ip route

if 30.0.0.0/8 is directly connected, Serial 3/

if 40.0.0.0/8 is directly connected, Fastethernet 0/0.

=> Now configuring the static IP addresses

of routes so that the communication can happen by / through all the networks present.

### Router 0

=> config t

=> ip route 30.0.0.0 255.0.0.0 20.0.0.20

=> ip route 40.0.0.0 255.0.0.0 20.0.0.20

=> no shut      => exit

### Router 1

=> config t

=> ip route 10.0.0.0 255.0.0.0 20.0.0.10

-> ip route 40.0.0.0 255.0.0.0 30.0.0.20  
-> no shut -> exit

### Router 2

-> config

-> ip route 10.0.0.0 255.0.0.0 30.0.0.10

-> ip route 20.0.0.0 255.0.0.0 30.0.0.10

-> no shut -> exit

-> Now again check if connections are

made properly.

### Router 0

-> exit

-> show ip route

c 10.0.0.0/8 is directly connected,

Fastethernet 0/0

c 20.0.0.0/8 is directly connected, Serial 2/0

S 30.0.0.0/8 [1/0] Via 20.0.0.20

S 40.0.0.0/8 [1/0] Via 20.0.0.20

### Router 1

-> exit

-> show ip route

S 10.0.0.0/8 [1/0] Via 20.0.0.10  
C 20.0.0.0/8 is directly connected, Serial 2/0  
C 30.0.0.0/8 is directly connected, Serial 3/0

S 40.0.0.0/8 [1/0] Via 30.0.0.20

### Router 2

=> exit

=> show ip route

S 10.0.0.0/8 [1/0] Via 30.0.0.10  
S 20.0.0.0/8 [1/0] Via 30.0.0.10  
C 30.0.0.0/8 is directly connected, Serial 3/0  
C 40.0.0.0/8 is directly connected, FastEthernet 0/0

### Output

=> Now passing ping message from  
PC0 to PC1

-> ping 40.0.0.1

Pinging 40.0.0.1 with 32 bytes of data:

Reply from 40.0.0.1: bytes = 32 time = 2 ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 18 ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 13 ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 9 ms  
TTL = 125

Ping statistics for 40.0.0.1

Packets: Sent = 4, Received = 4, Lost = 0  
(0% loss),

Approximate round trip times in milliseconds:

Minimum = 2 ms, Maximum = 18 ms,  
Average = 10 ms.

Now passing ping message from  
pc1 to pc0

→ Ping 10.0.0.1

Reply from 10.0.0.1: bytes = 32 Time = 16 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 Time = 4 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 Time = 12 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 Time = 4 ms  
TTL = 125

Ping statistics for 10.0.0.1:

Packets: Sent = 4, Received = 4, Lost = 0  
(0% loss)

Approximate round trip in milli-seconds:

Minimum = 4 ms, Maximum = 16 ms,

Average = 9 ms.

See

## Output:

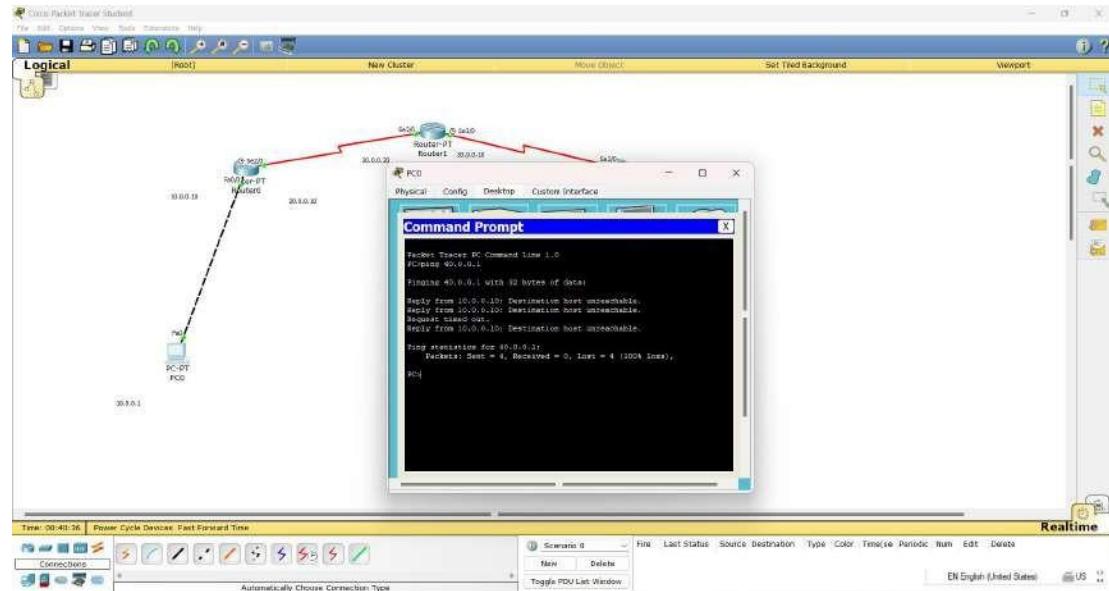

Fig 5: Pinging from pco to pc1 (with the messages destination host unreachable and request timed out)

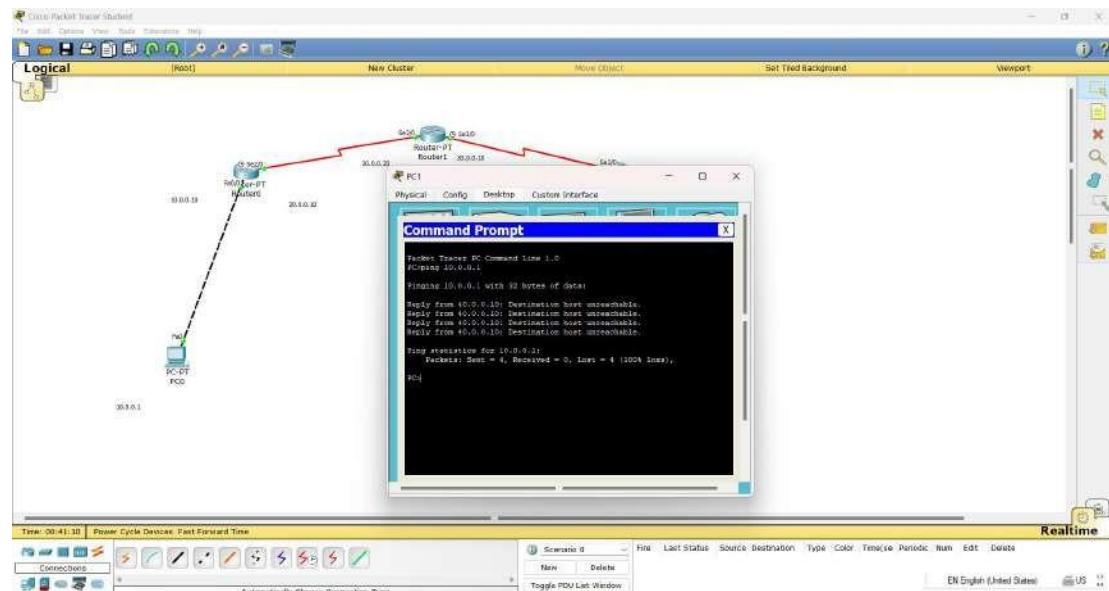

Fig 6: Pinging from pc1 to pc0 (with the messages destination host unreachable)

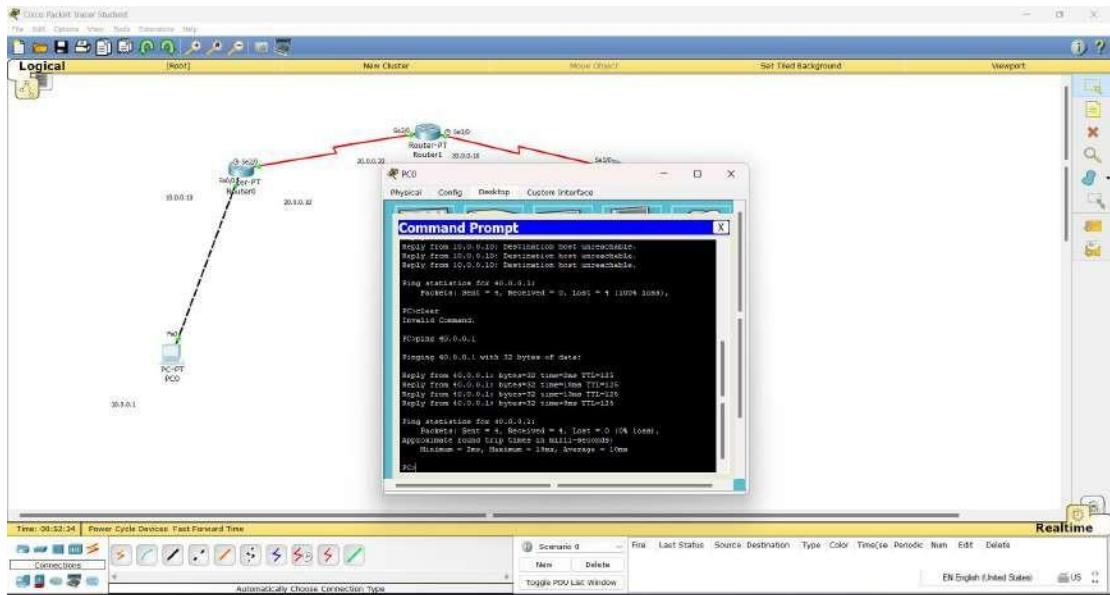

Fig 7: Pinging from pc0 to pc1 (message passing successful)

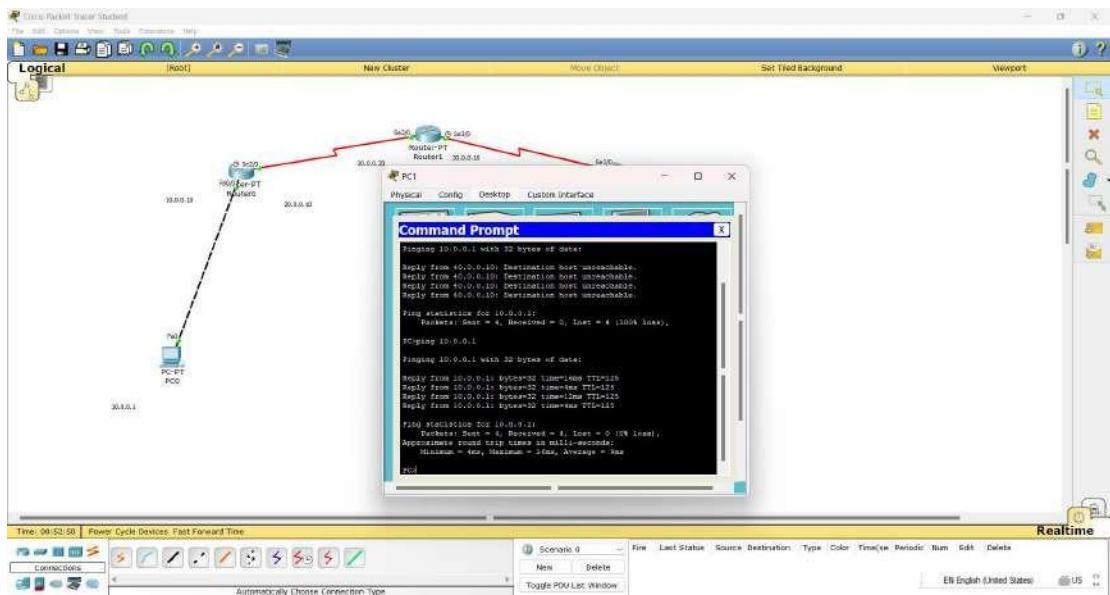

Fig 8: Pinging from pc1 to pc0 (message passing successful)

## Default Route:

### Topology:

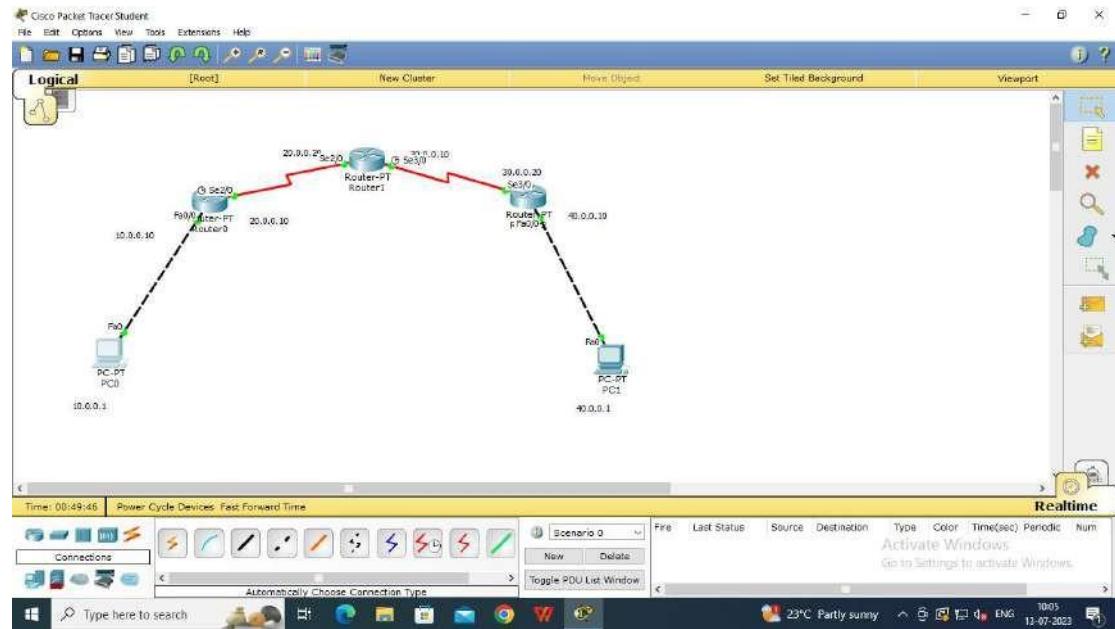

Fig 1: Topology

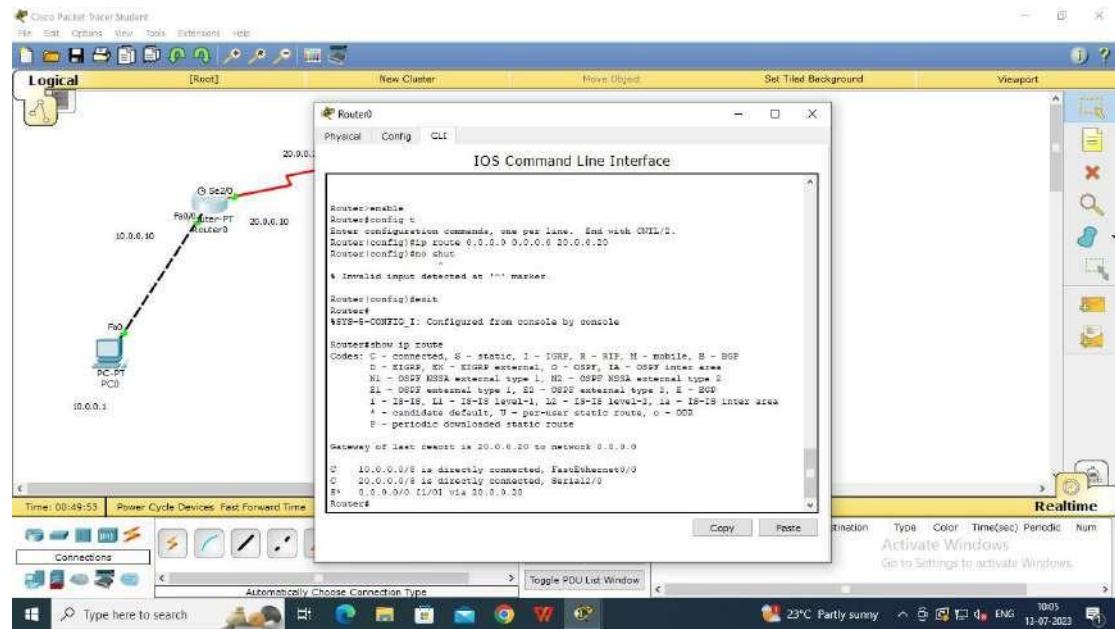

Fig 2: Router0 Connections

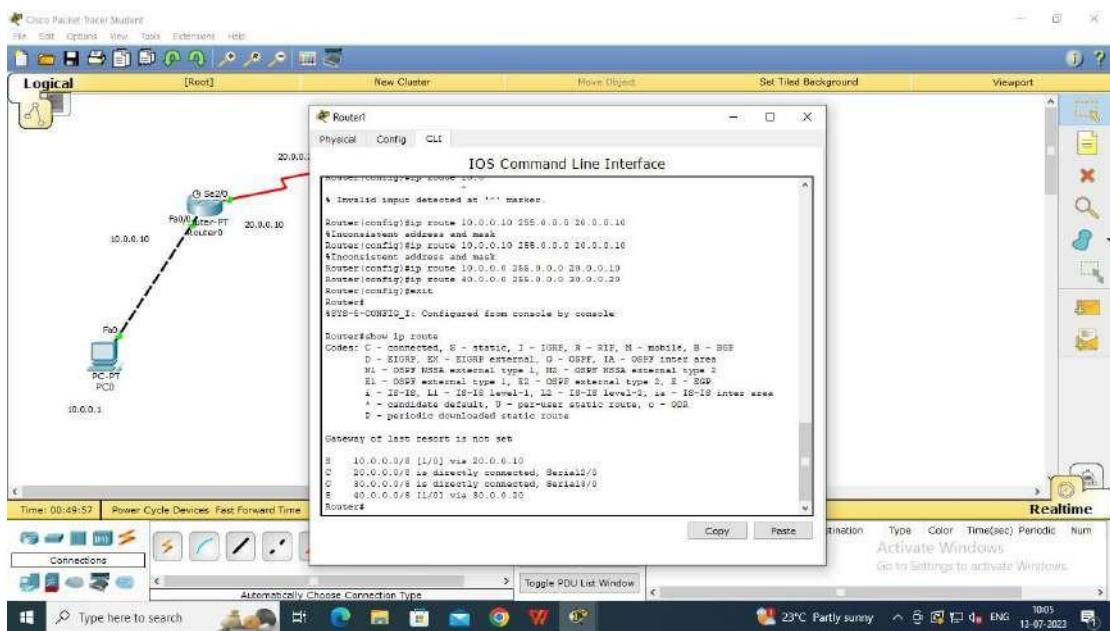

Fig 3: Router1 Connections

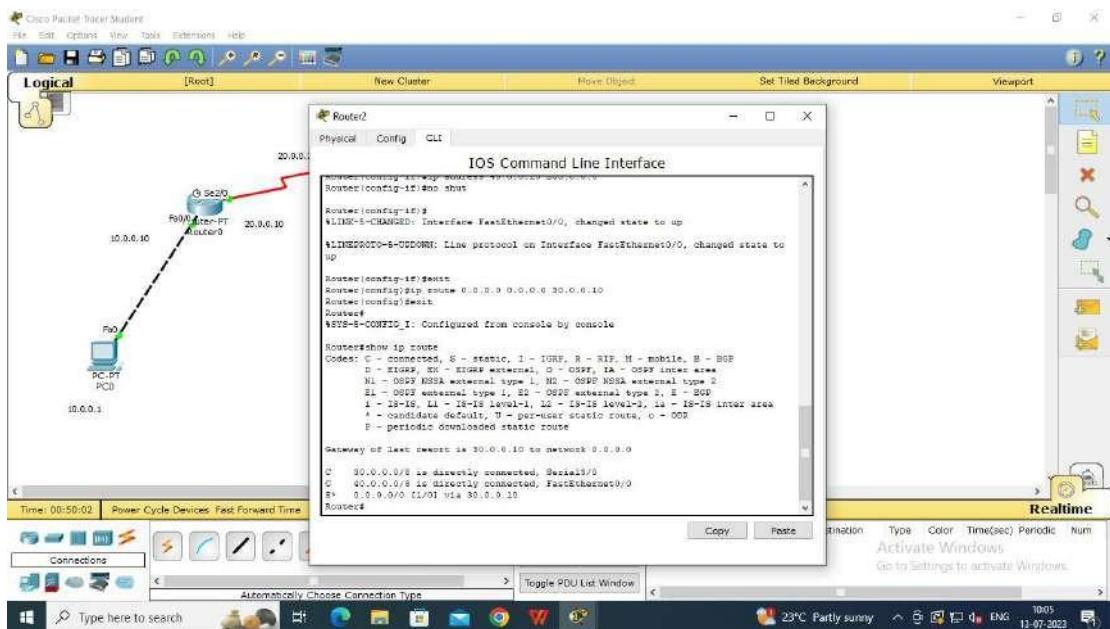

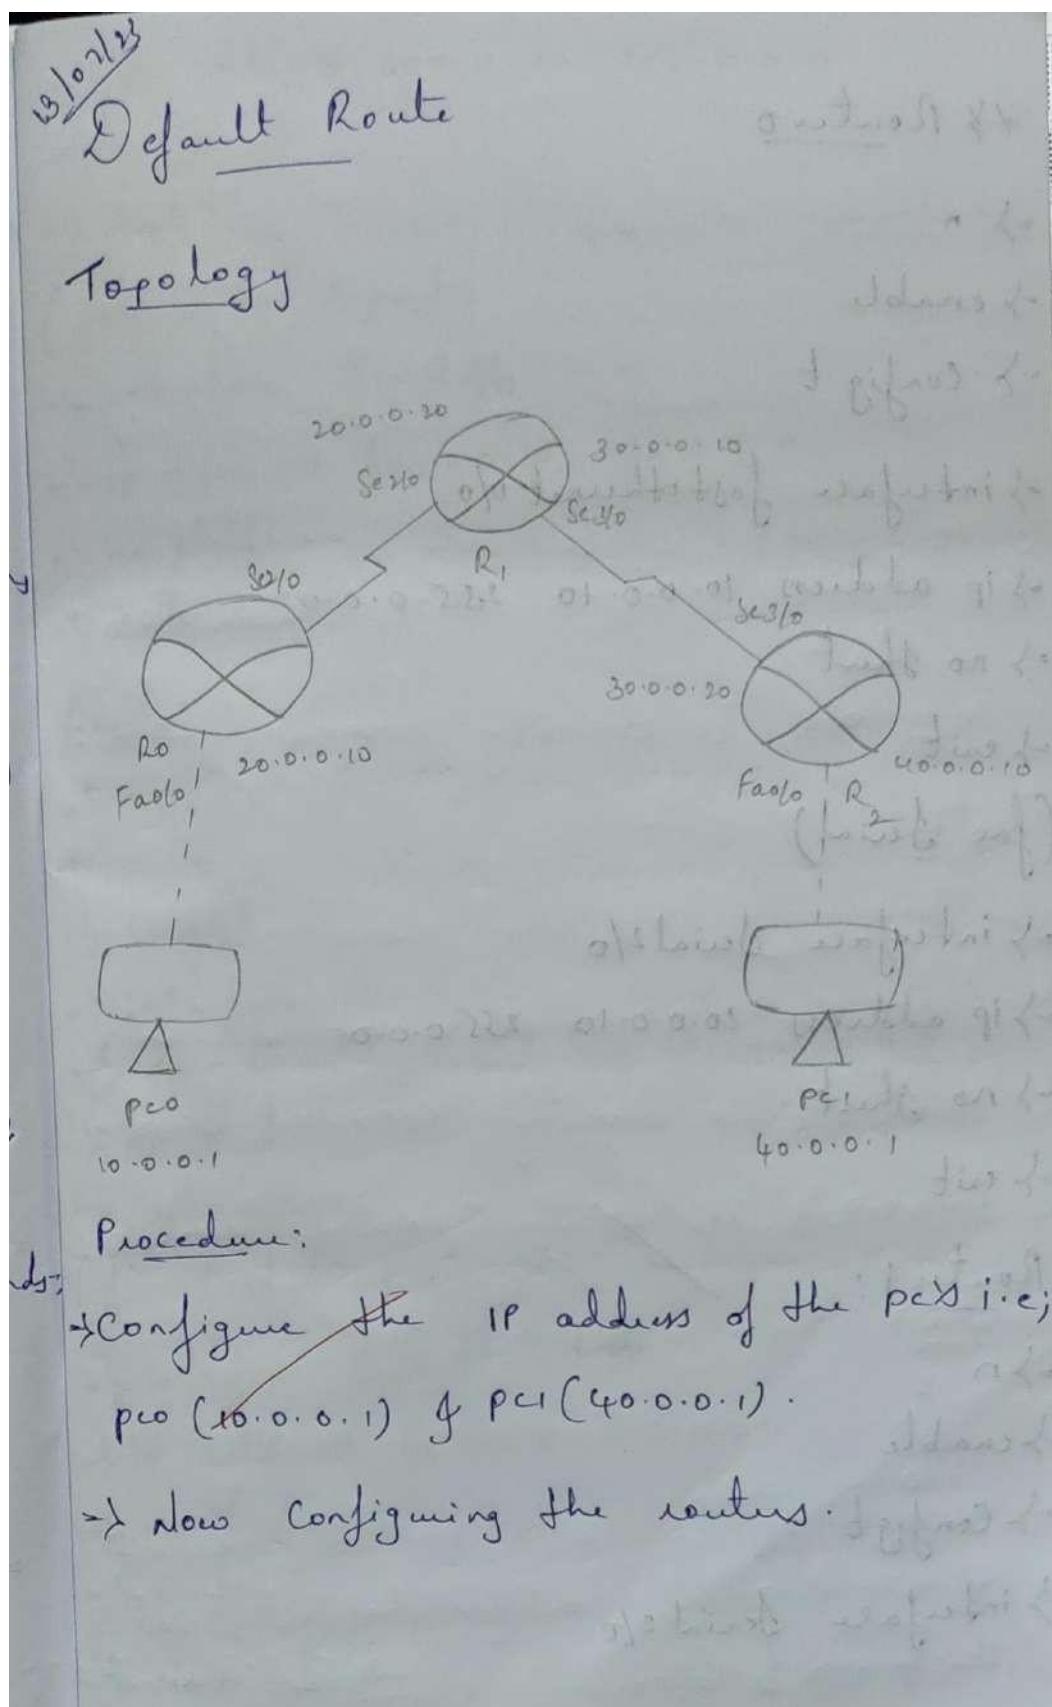

Fig 4: Router2 Connections

## Procedure and Observation:

### Procedure:

→ Configure the IP address of the PCs i.e;  
PC0 (10.0.0.1) & PC1 (40.0.0.1).

→ Now configuring the routers.

## +x Router 0

```
-> n  
-> enable  
-> config t  
-> interface fastethernet 0/0  
-> ip address 10.0.0.10 255.0.0.0  
-> no shut  
-> exit
```

(for Serial)

```
-> interface serial 2/0  
-> ip address 20.0.0.10 255.0.0.0  
-> no shut  
-> exit
```

## Router 1:

```
-> n  
-> enable  
-> config t  
-> interface serial 2/0
```

-> ip address 20.0.0.20 255.0.0.0

-> no shut

-> exit

(for Serial 3 port)

-> interface Serial 3/0

-> ip address 30.0.0.10 255.0.0.0

-> no shut

-> exit

Router 2:

-> ?

-> enable

-> config

-> interface Serial 3/0

-> no ip address 30.0.0.20 255.0.0.0

-> no shut

-> exit

(for fastethernet)

-> interface fastethernet 0/0

-> ip address 40.0.0.10 255.0.0.0

-> no shut

-> exit

-> Now check the connection & see if all

of them are connected.

### Router 0

→ exit

→ show ip route

\* c 10.0.0.0/8 is directly connected,  
FastEthernet 0%

c 20.0.0.0/8 is directly connected, Serial 2%

### Router 1

→ exit

→ show ip route

c 20.0.0.0/8 is directly connected, Serial 2%

c 30.0.0.0/8 is directly connected, Serial 3%

### Router 2

→ exit

→ show ip route

c 30.0.0.0/8 is directly connected, Serial 3%

c 40.0.0.0/8 is directly connected, FastEthernet 0%

→ Now configuring the default route  
all the routes connected or present, so that  
the communication can happen by / through  
all the routes & networks present.

### Route 0

→ config  
→ ip route 0.0.0.0 0.0.0.0 20.0.0.20

→ exit

### Route 1

→ config  
→ ip route 10.0.0.0 255.0.0.0 20.0.0.10

→ ip route 40.0.0.0 255.0.0.0 30.0.0.20

→ exit

### Route 2

→ config

→ ip route 0.0.0.0 0.0.0.0 30.0.0.10

→ exit

→ Now again check if connections the  
default route is proper.

### Router 0

→ show ip route

c 10.0.0.0/8 is directly connected,

FastEthernet 0%

c 20.0.0.0/8 is directly connected Serial 0%

s\* 0.0.0.0/0 [1/0] Via 20.0.0.20

### Router 1

→ show ip route

s 10.0.0.0/8 [1/0] Via 20.0.0.10

c 20.0.0.0/8 is directly connected, Serial 4%

c 30.0.0.0/8 is directly connected, Serial 3%

s 40.0.0.0/8 [1/0] Via 30.0.0.20

### Router 2

→ show ip route

c 30.0.0.0/8 is directly connected, Serial 3%

c 40.0.0.0/8 is directly connected, FastEthernet 0%

s\* 0.0.0.0/0 [1/0] Via 30.0.0.10

## Output

$\Rightarrow$  Now passing ping message from pc0 to  
pc1.

\*  $\rightarrow$  ping 40.0.0.1

Pinging 40.0.0.1 with 32 bytes of data:

Request timed out

Reply from 40.0.0.1: bytes = 32 time = 15ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 2ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 2ms  
TTL = 125

Ping statistics for 40.0.0.1:

Packets: Sent = 4, Received = 3, Lost = 1  
(25% Loss)

Approximate round trip times in milli-seconds:

/o Minimum = 2ms, Maximum = 15ms, Average  
= 6ms

Now again sending the ping message  
from PC0 to PC1.

⇒ Ping 40.0.0.1

Pinging 40.0.0.1 with 32 bytes of data,

Reply from 40.0.0.1: bytes = 32 time = 2ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 2ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 2ms  
TTL = 125

Reply from 40.0.0.1: bytes = 32 time = 2ms  
TTL = 125

Ping statistics for 40.0.0.1:

Packets: Sent = 4, Received = 4, Lost = 0 (0%)

Approximate round trip times in milliseconds:

Minimum = 2ms, Maximum = 2ms,

Average = 2ms.

-> Now pinging from PC1 to PC0.

-> ping 10.0.0.1

Pinging from 10.0.0.1: bytes = 32 time = 3 ms  
TTL = 125

Pinging 10.0.0.1 with 32 bytes of data:

Reply from 10.0.0.1: bytes = 32 time = 3 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 time = 8 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 time = 3 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 time = 3 ms  
TTL = 125

(loss) Ping statistics for 10.0.0.1:

0% packets lost, Sent = 4, Received = 4, Lost = 0 (0%)

Approximate round trip times in milli-seconds:

Minimum = 3 ms, Maximum = 9 ms, Average ~ 4 ms

## Observations

- configuring default ip route ensures that the packet passes through the default route when no other route is available for an ip destination address
- the simulation of sending a simple PDU from source to destination (here from pco to pci) shows the route taken by the ICMP protocol.

## Output:

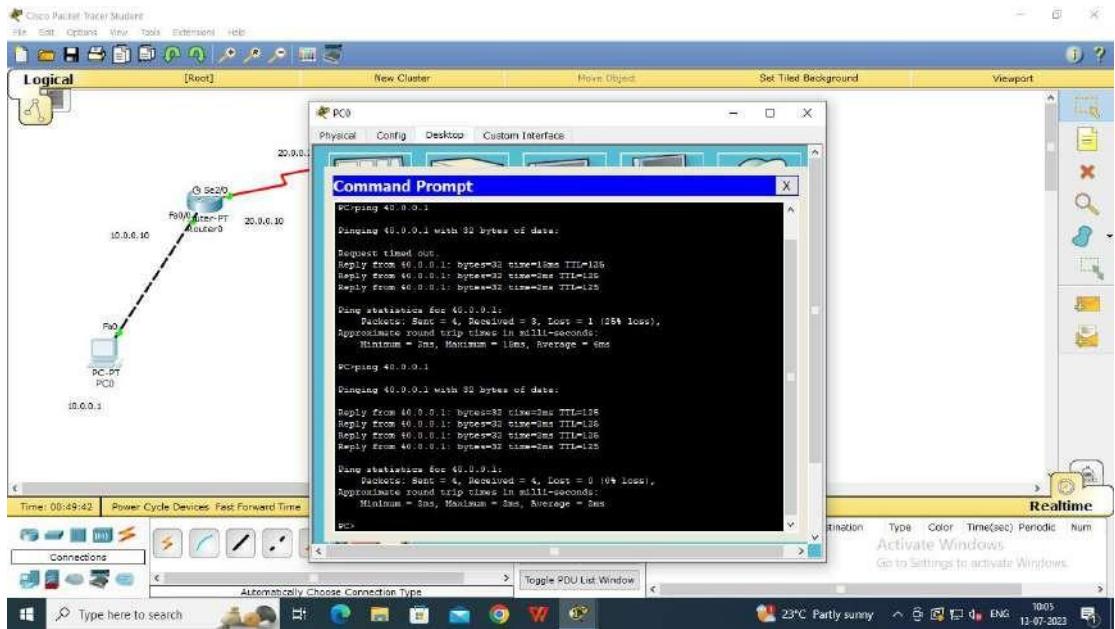

Fig 5: Pinging from pc0 to pc1

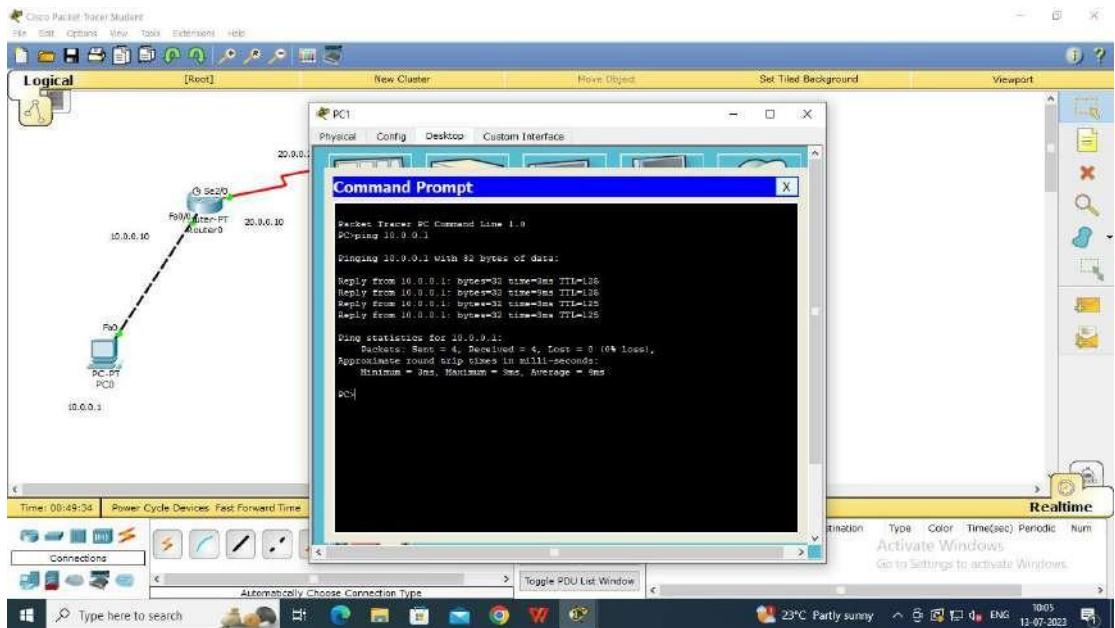

Fig 6: Pinging from pc0 to pc1

# Experiment No. 4

## Cycle 1

### Aim-4

4. Configure DHCP within a LAN and outside LAN.

Topology:

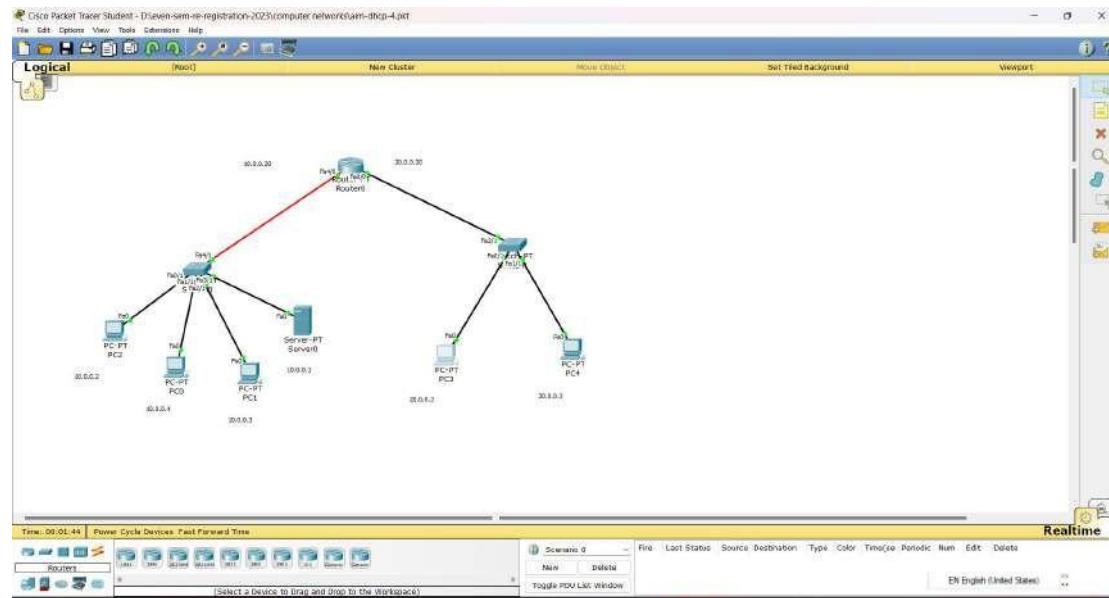

Fig 1: Topology

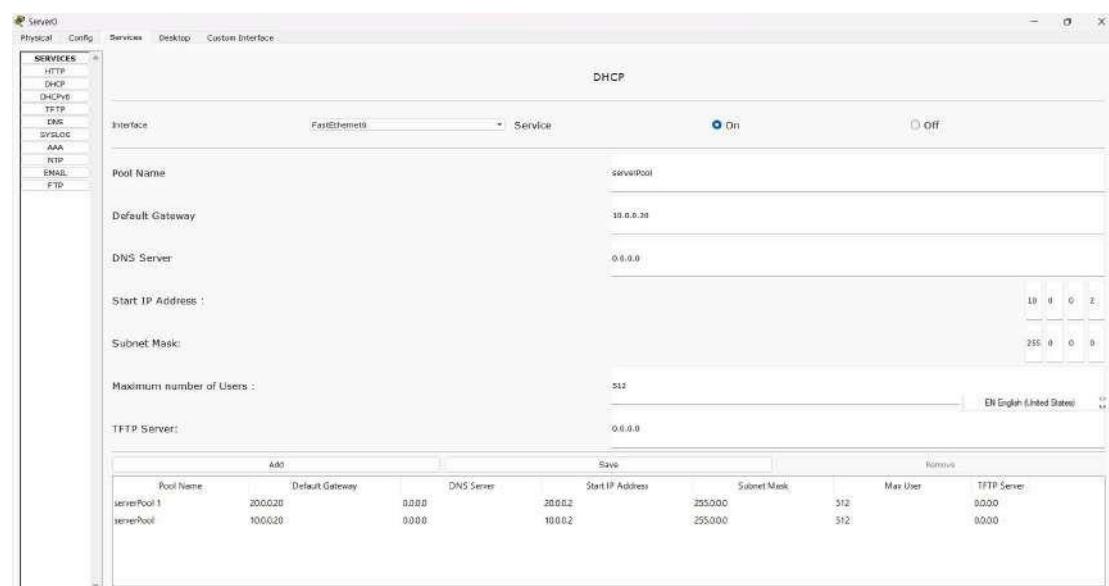

Fig 2: Configuring DHCP Settings in Server

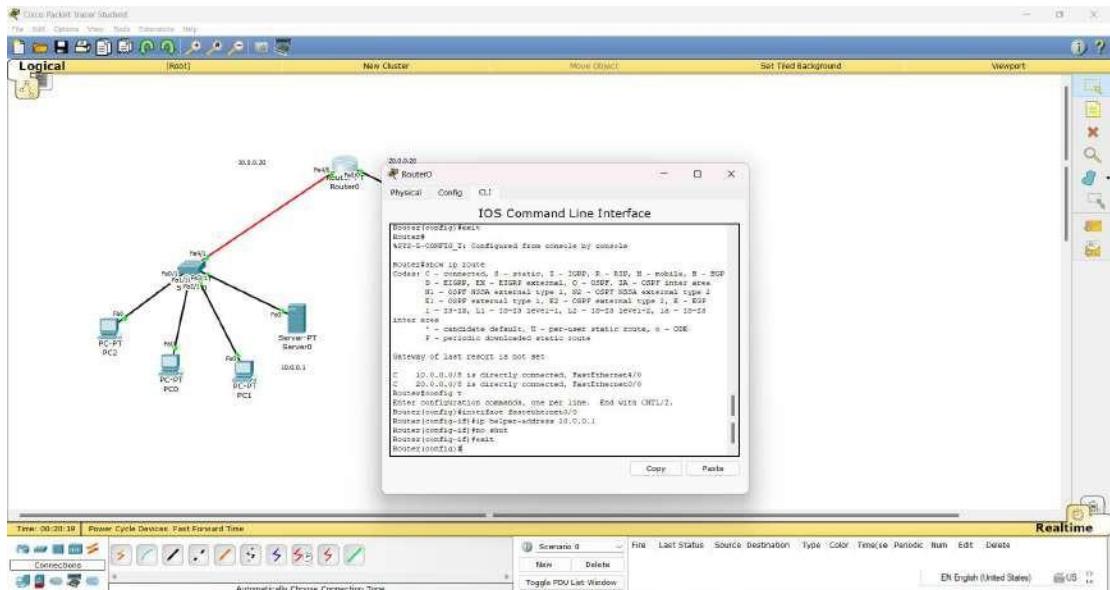

Fig 3: Router Configuring and Connections

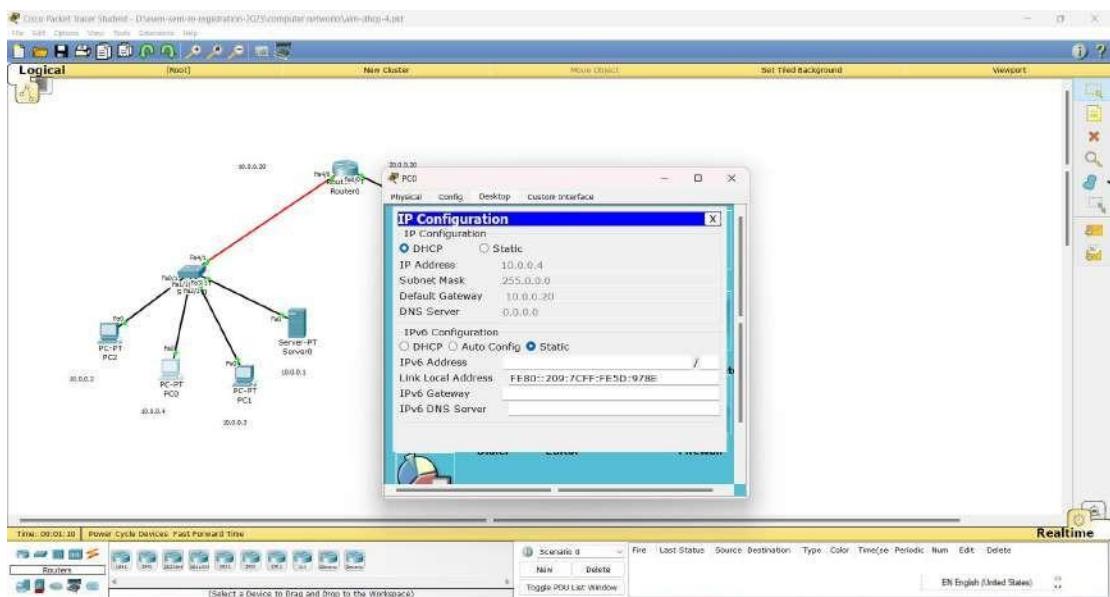

Fig 4: Pc0 Configurations

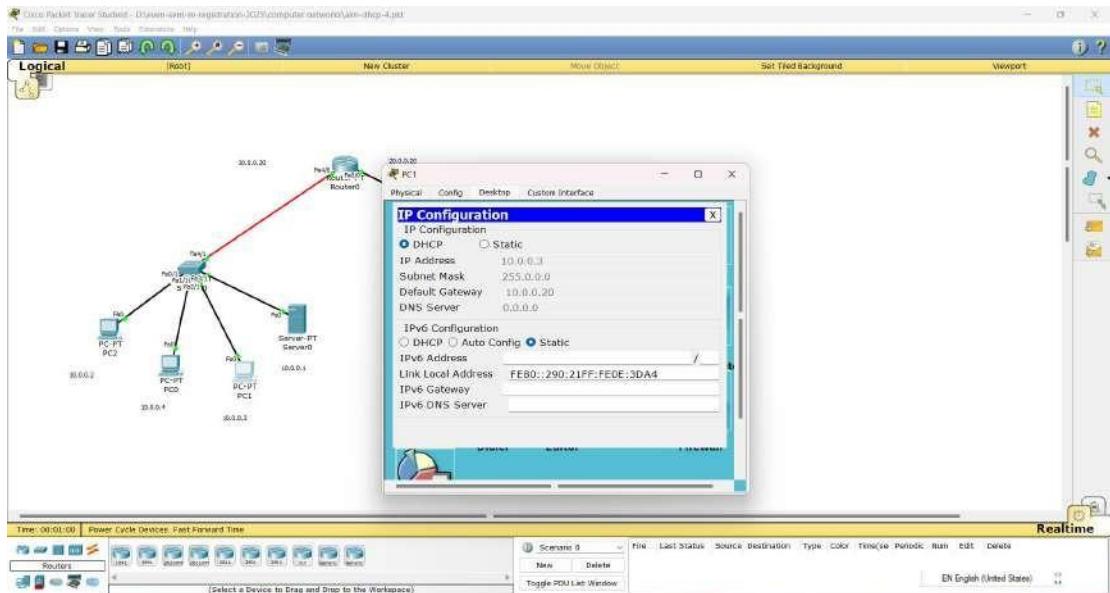

Fig 5: Pc1 Configurations

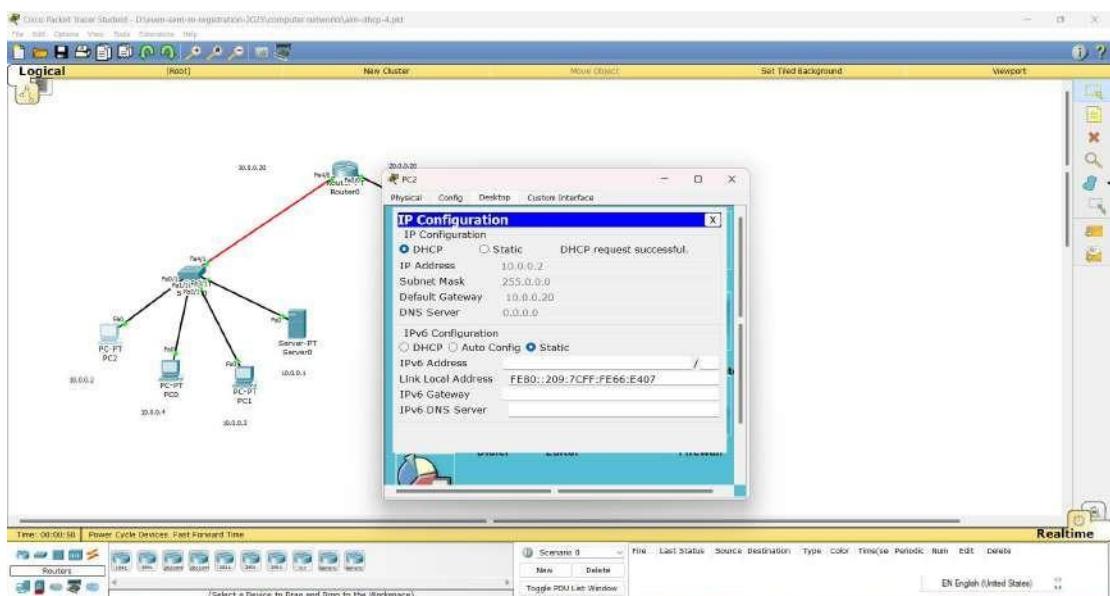

Fig 6: Pc2 Configurations

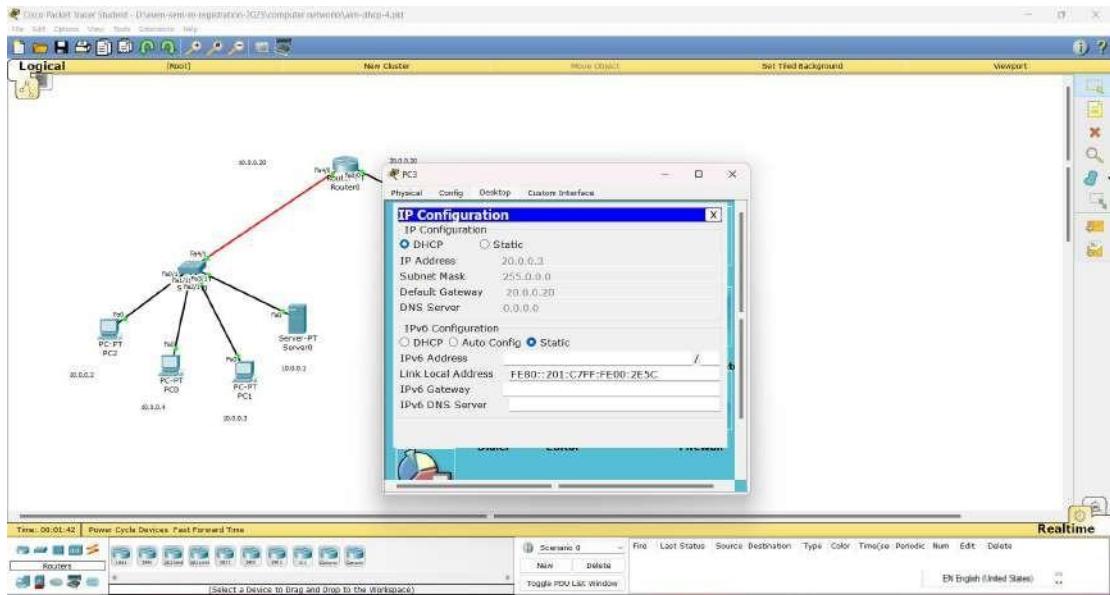

Fig 7: Pc3 Configurations

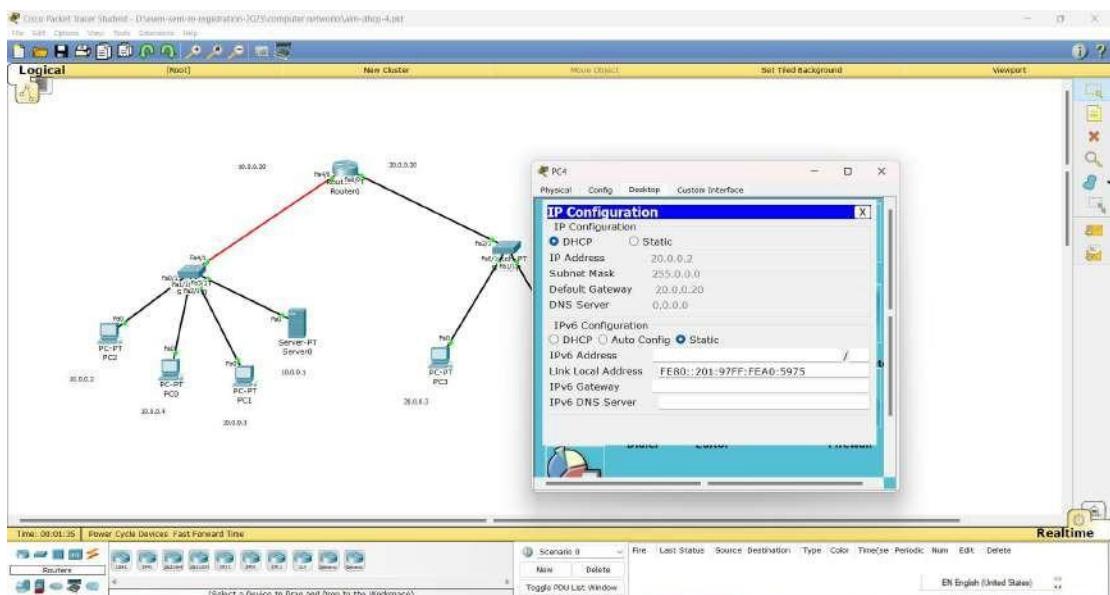

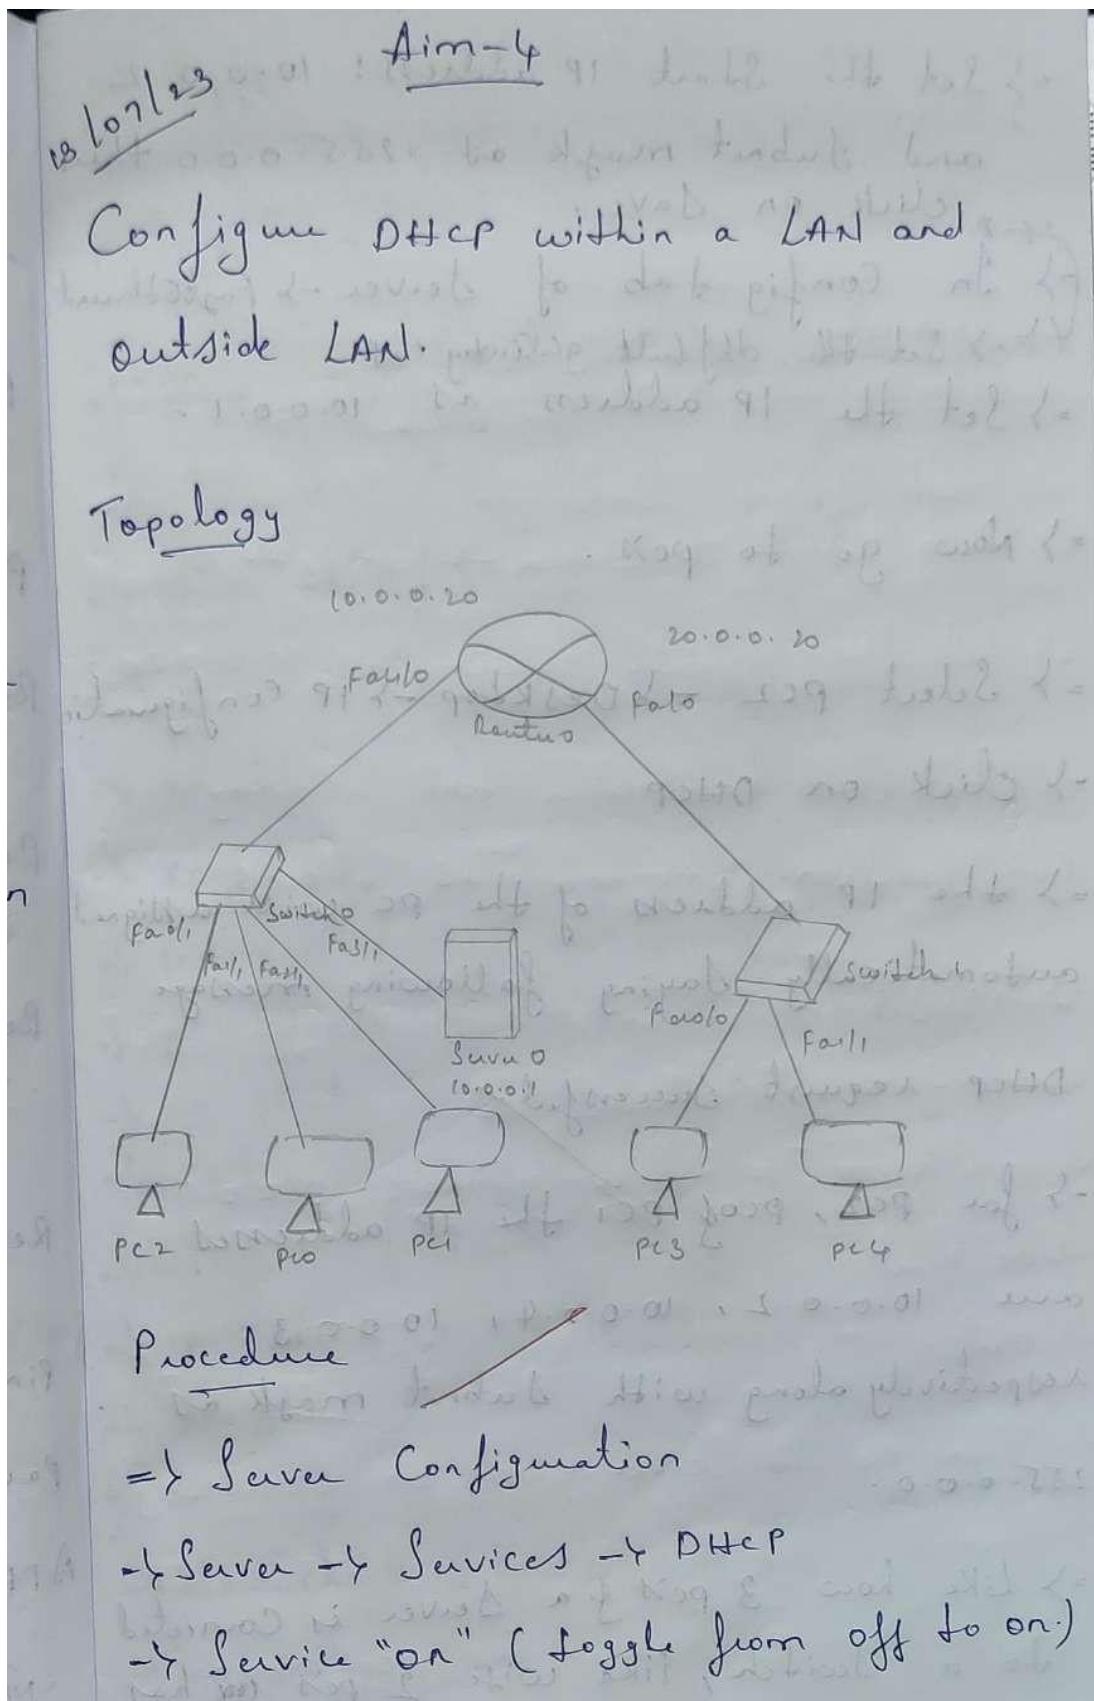

Fig 8: Pc4 Configurations

## Procedure and Observations:

- Set the Start IP address: 10.0.0.2  
and Subnet mask as 255.0.0.0 then click on Save.
- In config tab of Server → FastEthernet
  - Set the default gateway as 10.0.0.1
- Set the IP address as 10.0.0.1
- Now go to PCs.
- Select pc2 → Desktop → IP configuration
- click on DHCP
- The IP address of the PC will be assigned automatically saying following message  
DHCP request successful
- For PC2, PC3 & PC1 the IP addresses are 10.0.0.2, 10.0.0.4, 10.0.0.3 respectively along with Subnet mask as 255.0.0.0.
- Like how 3 PCs & a Server is connected to a switch, likewise 2 PCs can have

→ To be connected to a one more switch (Basically lan) (Say Switch, pc3 & pc4)

→ And Switch 0 of Switch 1 has to be connected to a route.

→ Now configuring the route

→ ip address 10.0.0.10 255.0.0.0

→ enable of this switch no idea what it is

→ config t do a command nothing found

→ interface fastethernet 4/0

→ ip address 10.0.0.20 255.0.0.0

→ no shut

→ exit

→ interface fastethernet 0/0

→ ip address 20.0.0.20 255.0.0.0

→ no shut

→ exit

→ Now check if connections are proper.

→ show ip route

c 10.0.0.0/8 is directly connected,  
Fast Ethernet 4/0

c 20.0.0.0/8 is directly connected  
Fast Ethernet 0/0

→ Now click on Server → config + #

→ Set the default gateway as 10.0.0.20.

→ Now click on Router and following  
Configuration commands are as follows

→ config t

→ interface fastethernet 0/0

→ ip address 10.0.0.1 255.255.255.0

→ no shut

→ exit.

→ Then go to Server click on Services

→ tap

→ In DHCP change the pool Name  
as Serverpool 1

- > then set the Start IP address as 20.0.0.2 and click on add and save.
- > now click on pc which are connected to switch.
- => pc -> desktop -> IP configuration  
-> DHCP
- > the IP addresses & Subnet mask will assigned automatically.
- > the IP address for PC3 & PC4 are 20.0.0.3 & 20.0.0.8 respectively and Subnet mask as 255.0.0.0
- > In DHCP (Server) for Server pool set default observation gateway as 10.0.0.20 for Server pool 1 also same 20.0.0.29 and click on save each time the default gateway is being set.
- > Dynamic Host Configuration Protocol (DHCP)
- > It works on DORA application
- > DORA is D (Discover), O (Offer), R (Request) & A (Acknowledgement)

→ Basically the client broadcasts for network

→ Server offers the client  
if the client requests the server  
→ and server sends the acknowledgement  
to clients and assigns the IP or provides  
the IP address to the client which has  
requested.

Output  
→ Pinging messages from PC4 to PC1

Ping 10.0.0.2  
Pinging 10.0.0.2 with 32 bytes of data!  
Request timed out

Reply from 10.0.0.2: bytes = 32 time = 0ms

## Output:

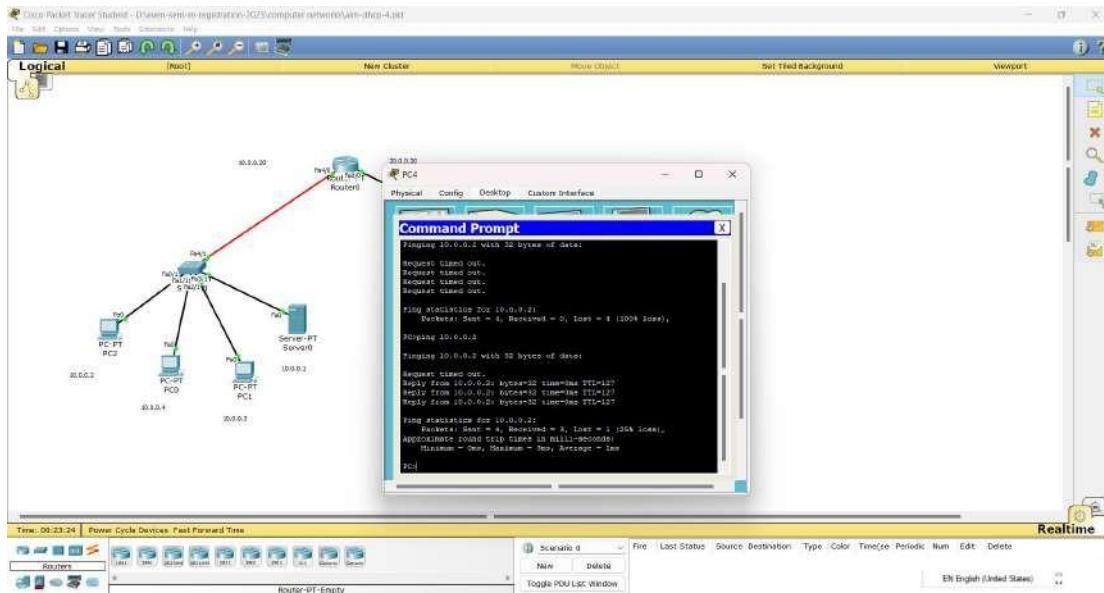

Fig 9: Pinging from pc4 to pc2

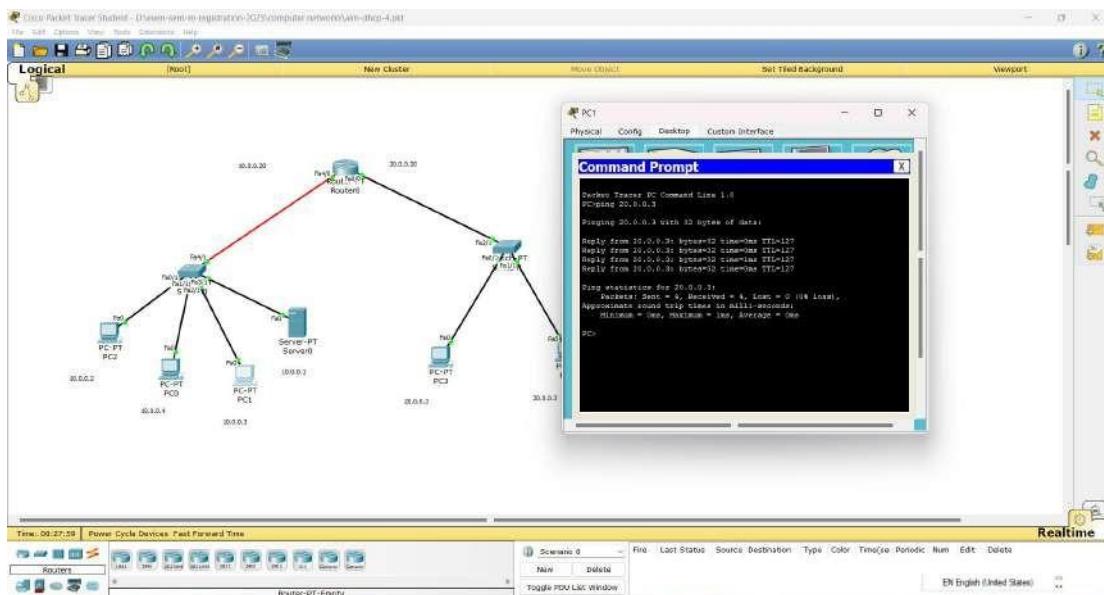

Fig 10: Pinging from pc1 to pc3

# Experiment No. 5

## Cycle 1

### Aim-5

#### 5. Configure RIP routing protocol in Routers

Topology:

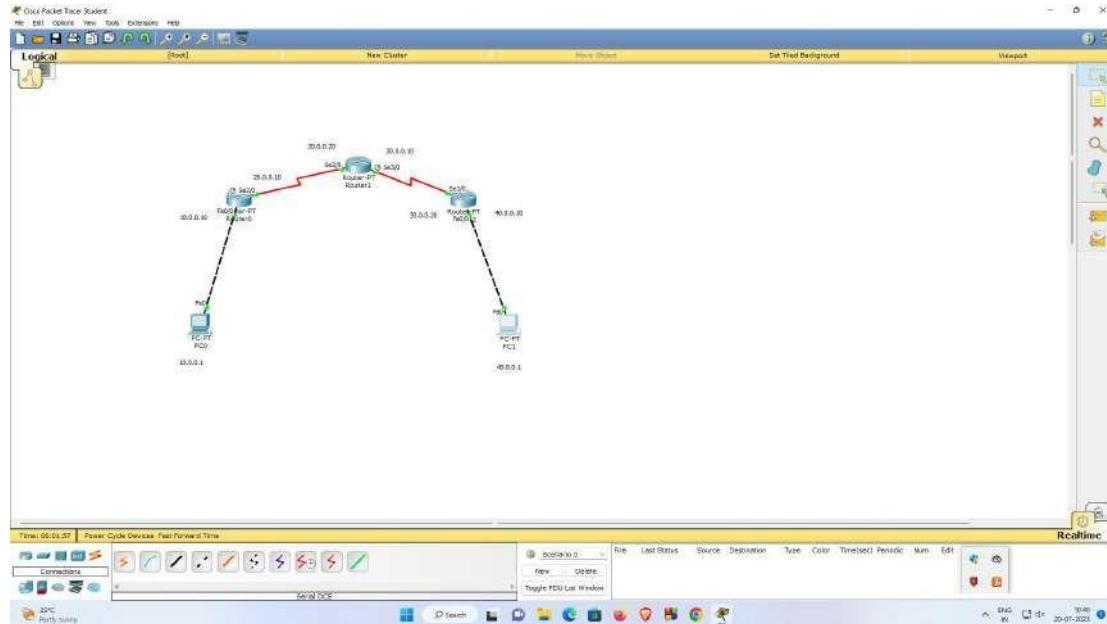

Fig 1: Topology

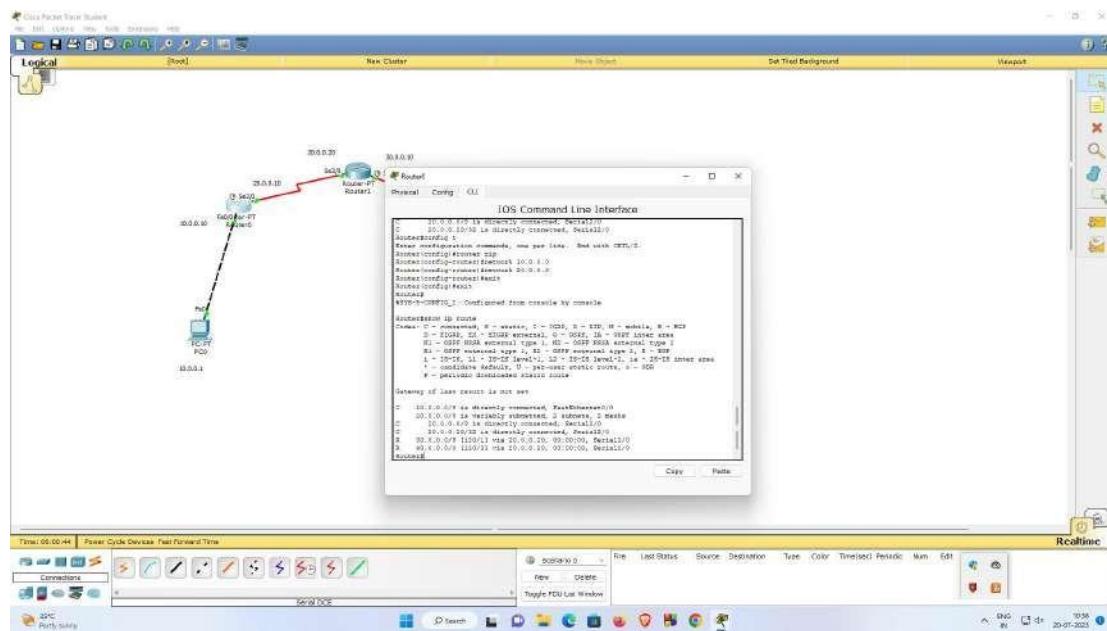

Fig 2: Router 0 networks and next hop ip addresses

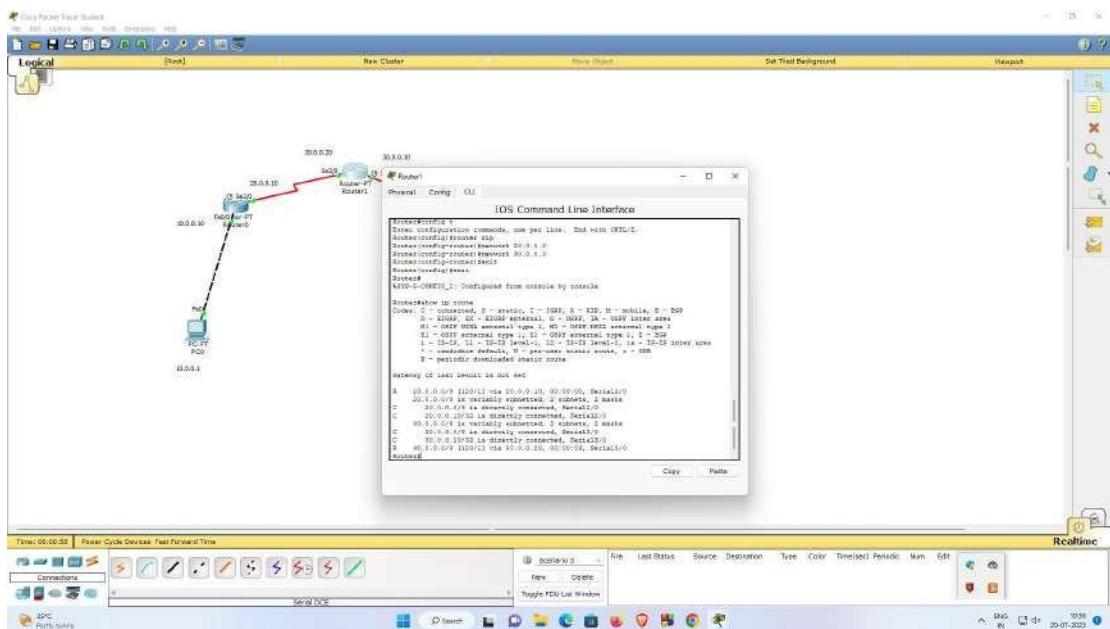

Fig 3: Router 1 networks and next hop ip addresses

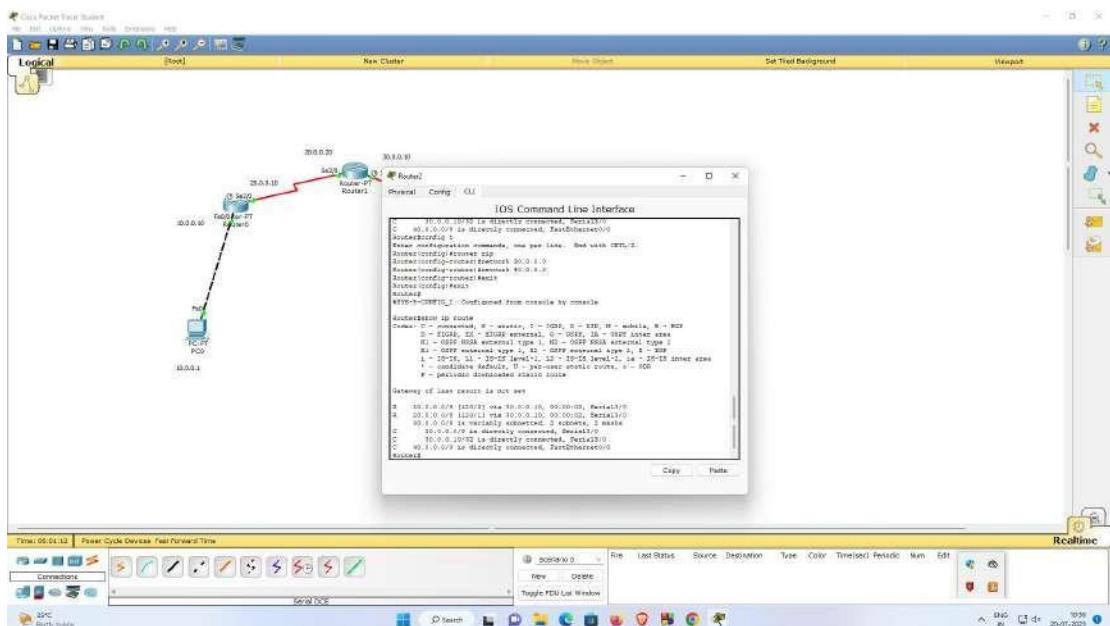

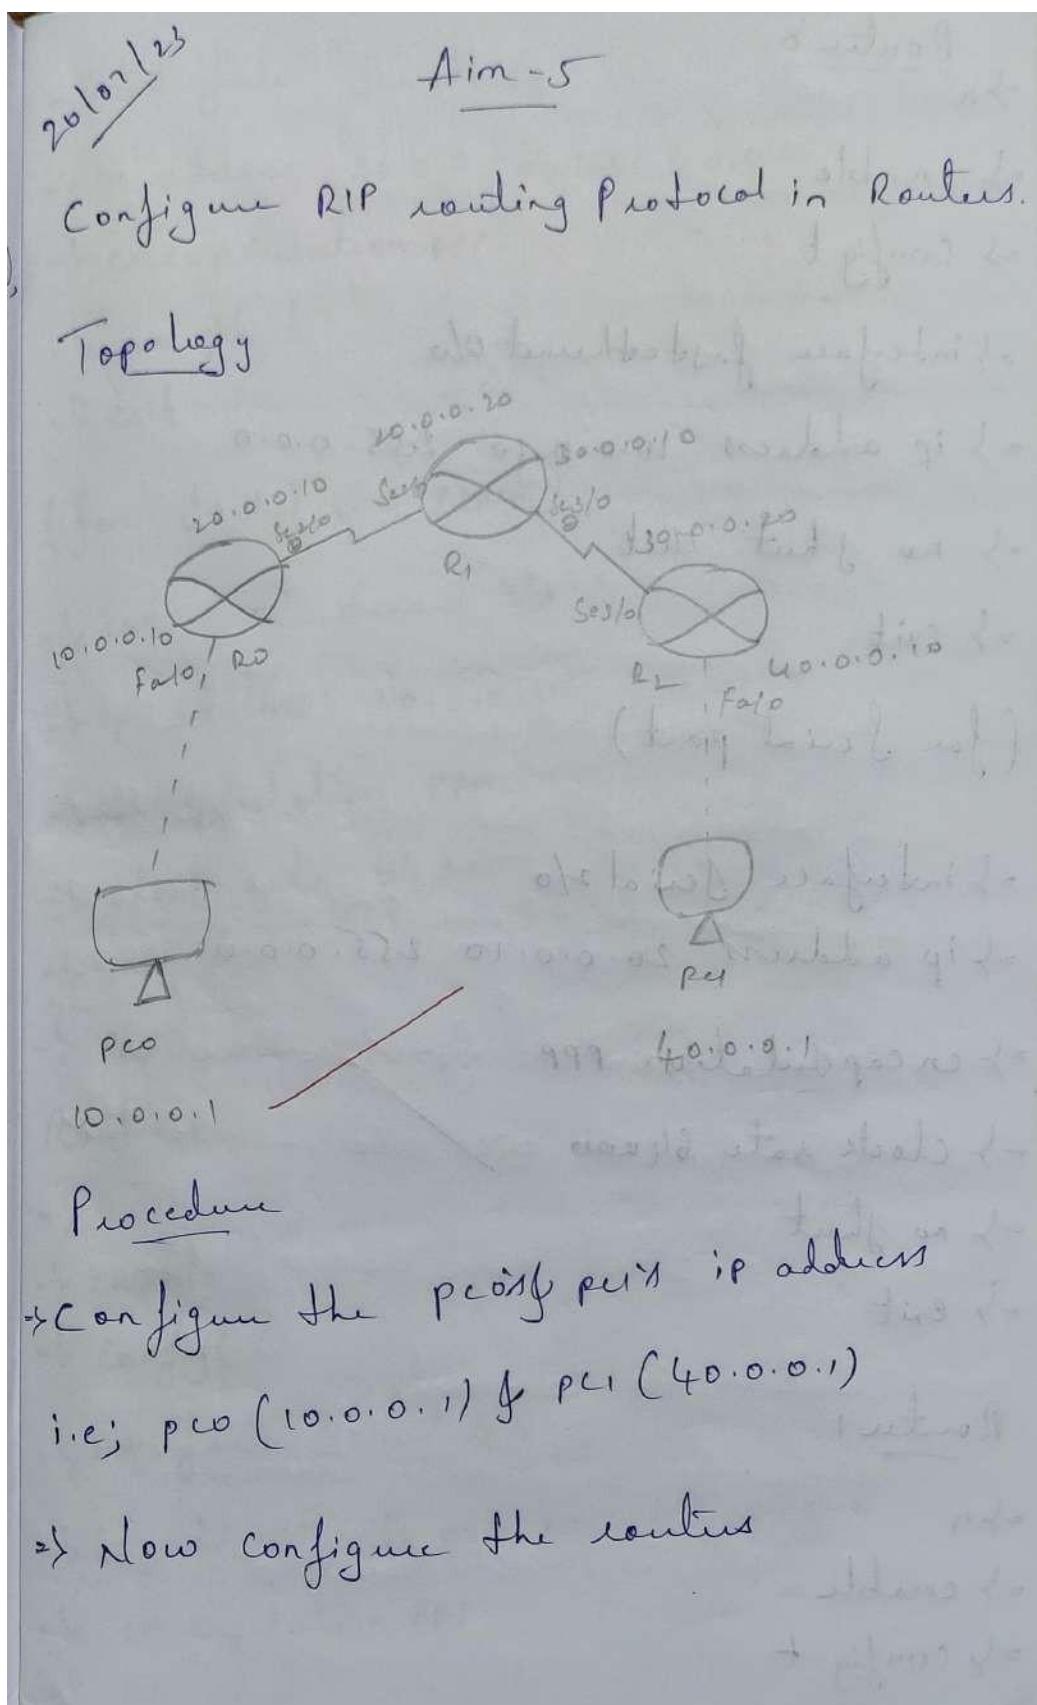

Fig 4: Router 2 networks and next hop ip addresses

## Procedure and Observation:

### Router 0

```
→ n  
→ enable  
→ config t  
→ interface fastethernet 0/0  
→ ip address 10.0.0.10 255.0.0.0
```

```
→ no shutdown
```

```
→ exit
```

(for Serial port)

```
→ interface serial 2/0  
→ ip address 20.0.0.10 255.0.0.0
```

```
→ encapsulation ppp
```

```
→ clock rate 64000
```

```
→ no shutdown
```

```
→ exit
```

### Router 1

```
→ n  
→ enable  
→ config t
```

-> interface serial 2/0

-> ip address 20.0.0.20 255.0.0.0

-> encapsulation ppp

-> no shut

-> exit

(for serial 3/0 port)

-> interface serial 3/0

-> ip address 30.0.0.10 255.0.0.0

-> encapsulation ppp

-> clock rate 64000

-> no shut

-> exit

Route 2

-> n

-> enable

-> configt

-> interface serial 3/0

-> ip address 30.0.0.20 255.0.0.0

-> encapsulation ppp

-> no shut -> exit

(for fast ethernet port)

→ interface fastethernet 0/0

→ ip address 40.0.0.10 255.0.0.0

→ no shut

→ exit

### Note:

→ As here it is rip routing for all serial interfaces we use/include this entire command i.e; "encapsulation ppp".

→ And for serial interfaces ~~with~~<sup>only</sup> which has clock symbol we use/include this command i.e; "clock rate 64000" (after encapsulation ppp command).

-> Now check the connected networks (for help)

Routert#

-> exit

-> show ip route

-> Now we've to make routers  
to themselves know <sup>help</sup> about the  
networks present. For that we need  
to use following commands

Routert#

-> config t

-> router rip

-> network 10.0.0.0

-> network 20.0.0.0

-> exit

Routert#

-> config t

-> router rip

-> network 20.0.0.0

-> network 30.0.0.0

-> exit

Router 2

-> Config t

-> route ip

-> network 30.0.0.0

-> network 40.0.0.0

-> exit

=> Now check the connected networks  
and the next hops of all the routes

Router 3

-> exit

-> show ip route

Average = 7 ms

⇒ Pinging from pci to pco

> Ping 10.0.0.1!

Pinging 10.0.0.1 with 32 bytes of data:

Reply from 10.0.0.1: bytes = 32 time = 12 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 time = 7 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 time = 12 ms  
TTL = 125

Reply from 10.0.0.1: bytes = 32 time = 9 ms  
TTL = 125

Ping statistics for 10.0.0.1:

Packets: Sent = 4, Received = 4, Lost = 0  
(0% loss)

Approximate round trip times in milli-  
seconds

Minimum = 7 ms, Maximum = 12 ms,

Average = 10 ms.

### Observation

- RIP is (Routing Information Protocol)
- It uses distance vector algorithm
- when you use this particular protocol the routers themselves learn about the other networks present and the next hop to be communicated.

→

## Output:

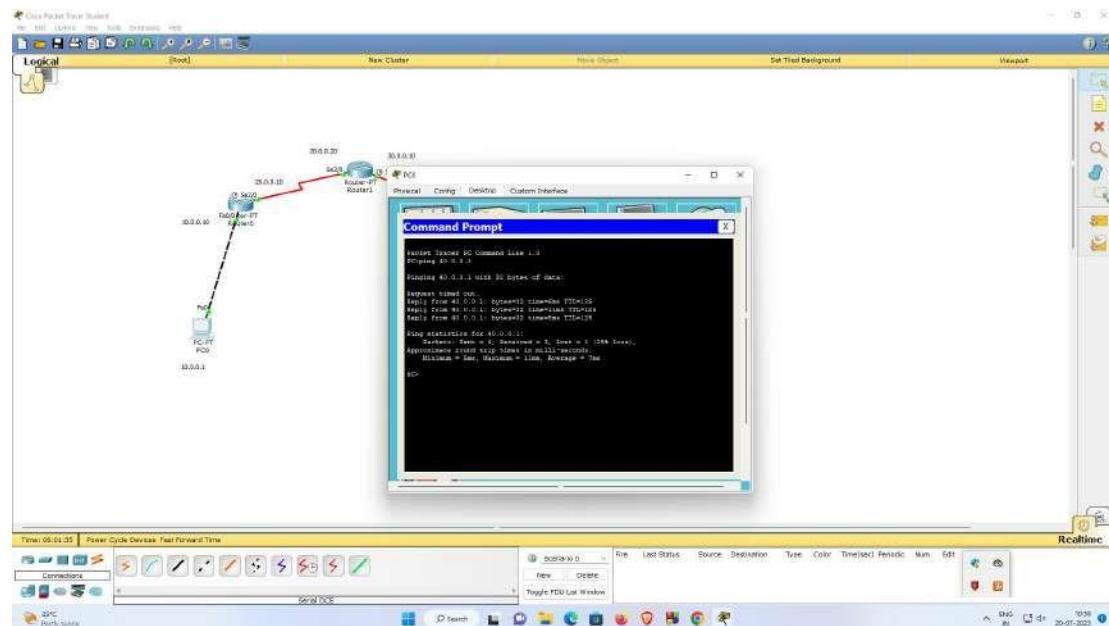

Fig 5: Pinging from pc0 to pc1

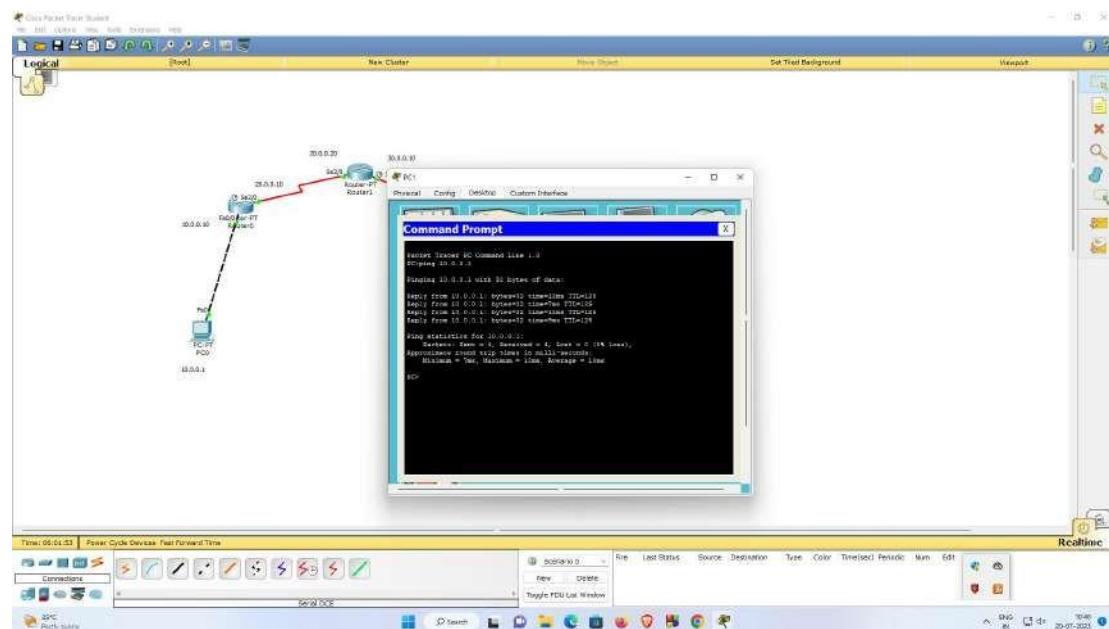

Fig 6: Pinging from pc1 to pc0

# Experiment No. 6

## Cycle 1

### Aim-6

6. Configure Web Server, DNS within a LAN.

Topology:

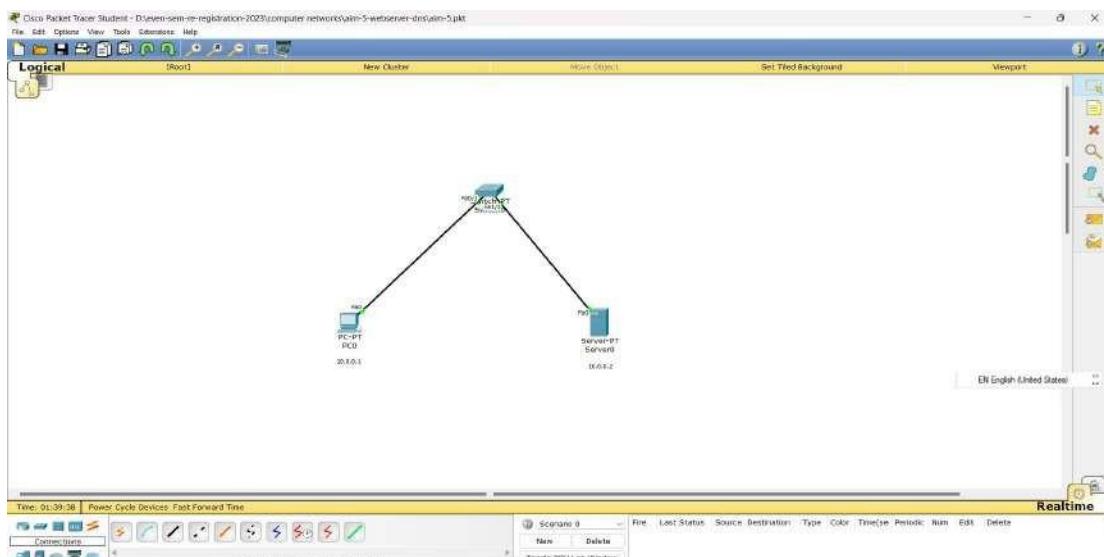

Fig 1: Topology

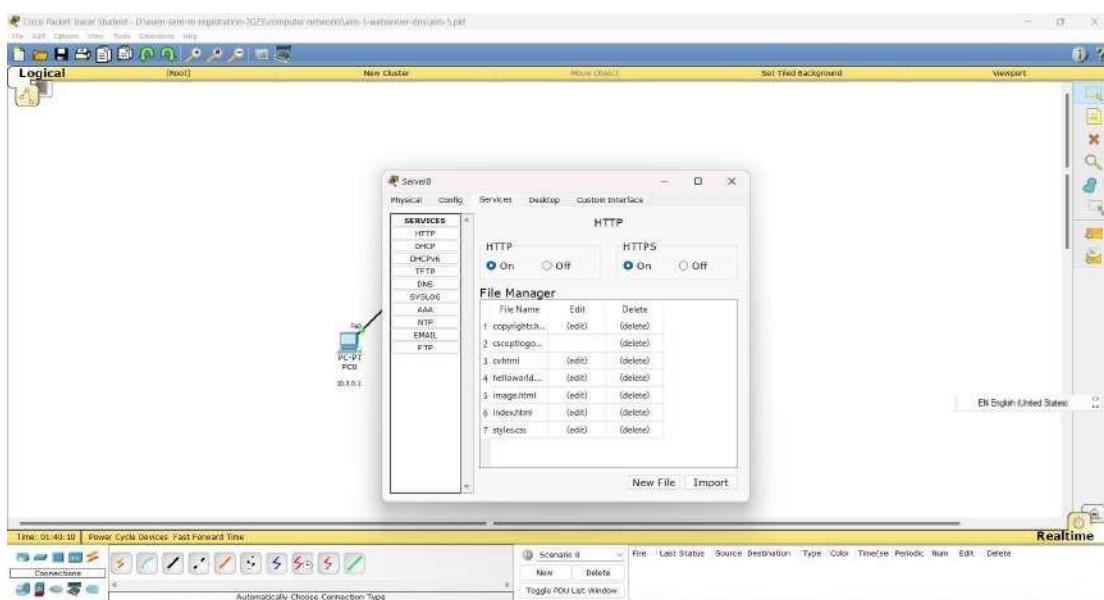

Fig 2: Adding new web page and integrating it into the existing one in Server's HTTP service tab

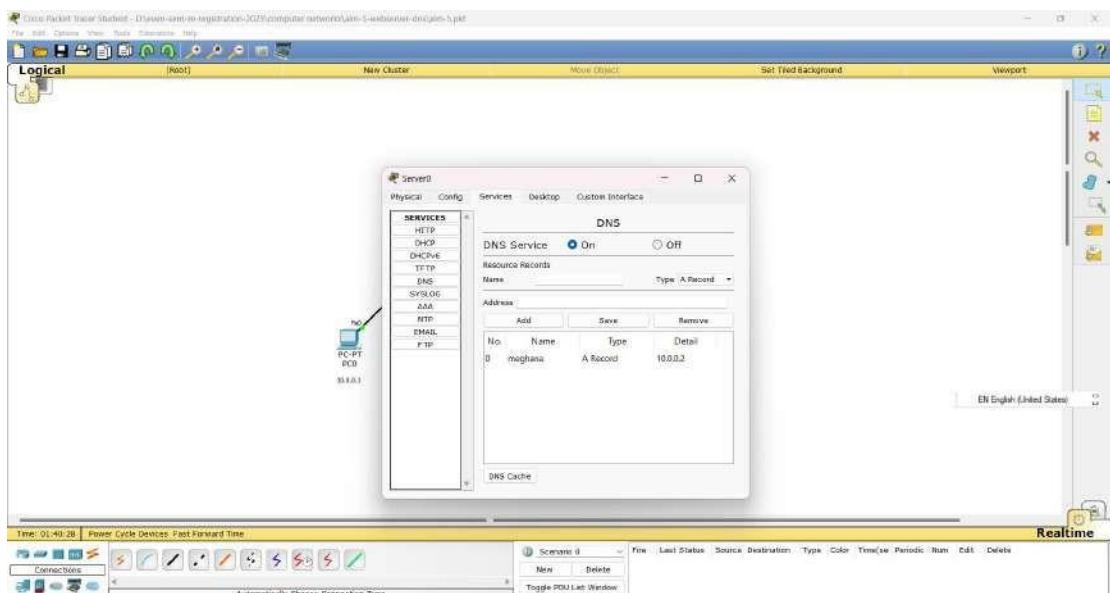

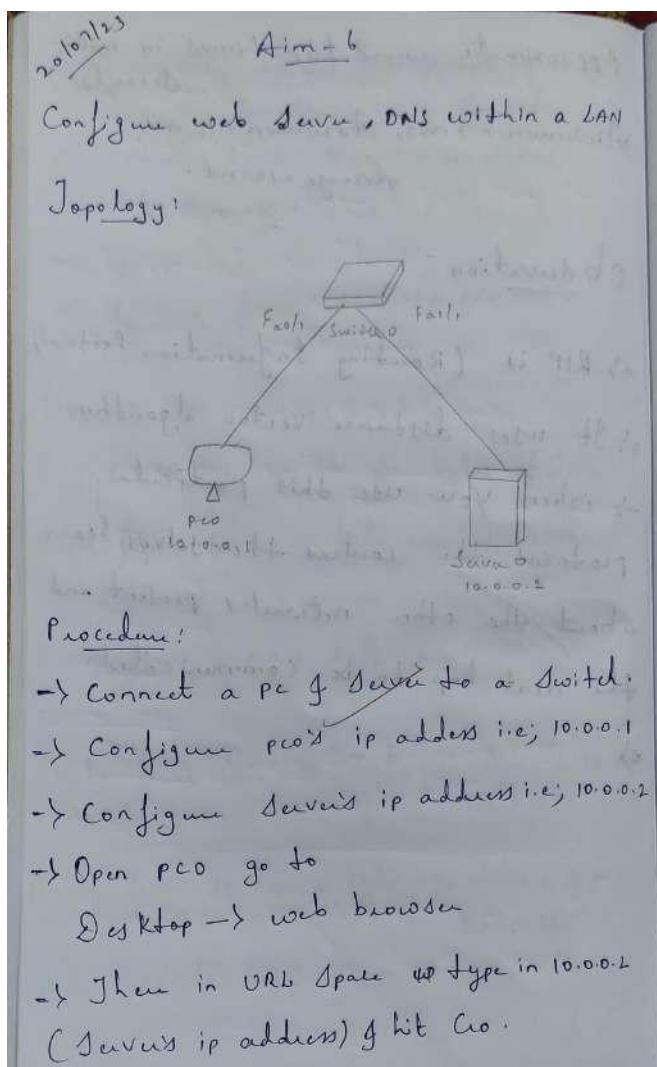

Fig 3: Configuring in Server's DNS service tab

### Procedure and Observation:

→ A small web page of cisco packet tracer  
pops out.

→ Now go to Server → Services tab -> HTTP

→ Keep HTTP "On"

→ Then in File manager, create a small  
simple cr (just for practice purpose to check  
if the web page is working after editing)  
file (Newfile/import).

→ Now go to "DNS" of Services tab of  
Server.

→ Keep ~~DNS~~ "on".

→ Name: Meghana (any name can be  
written).

→ Address: 10.0.0.2 (Services ip address)

2 → Then hit "Add".

→ Now go to pco

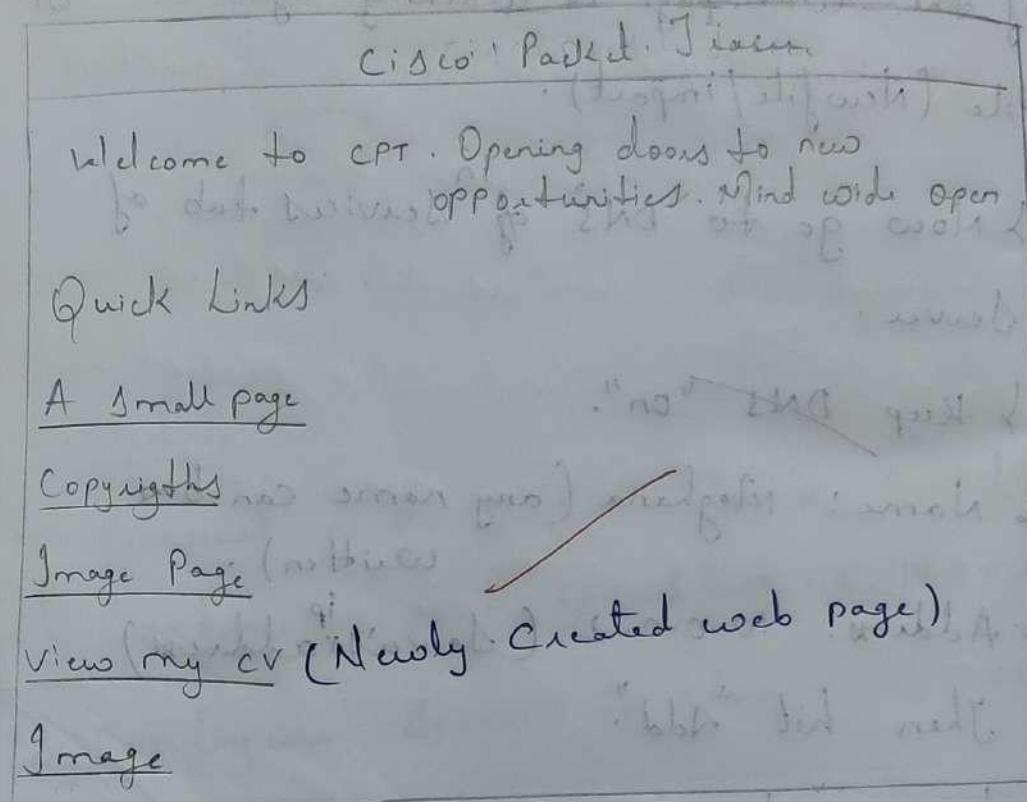

→ pco → web browser -> URL (meghana)

→ instead of Services ip address mention

the name which was done in  
Server.

- A small web page pops out with the new addition i.e; "cv.html" file.
- when you click on it you can see view newly created cv file.

Output URL http://meghana.co.in

- Now click on "View my cv (link)" it will open a small simple basic cv web page.

Meghana

Email: meghana@gmail.com

Phone: 1234567890

Website: www.linkedin.com/in/meghana

### Education

Computer Science and Engineering, BE, BMS College of  
Engineering, 2023

High School, ABC School, 20XX

### Skills and Programming Languages

HTML      Python      C++  
CSS      Java  
JavaScript      Language      problem solving

### Observation

- DNS (Domain name System)
- It basically works on how map / associate ip address <sup>to</sup> domain name.
- It redirects to the <sup>default</sup> Cisco packet tracer web browser page after assigning the ip address of the to the server.

10/10/23

## Output:

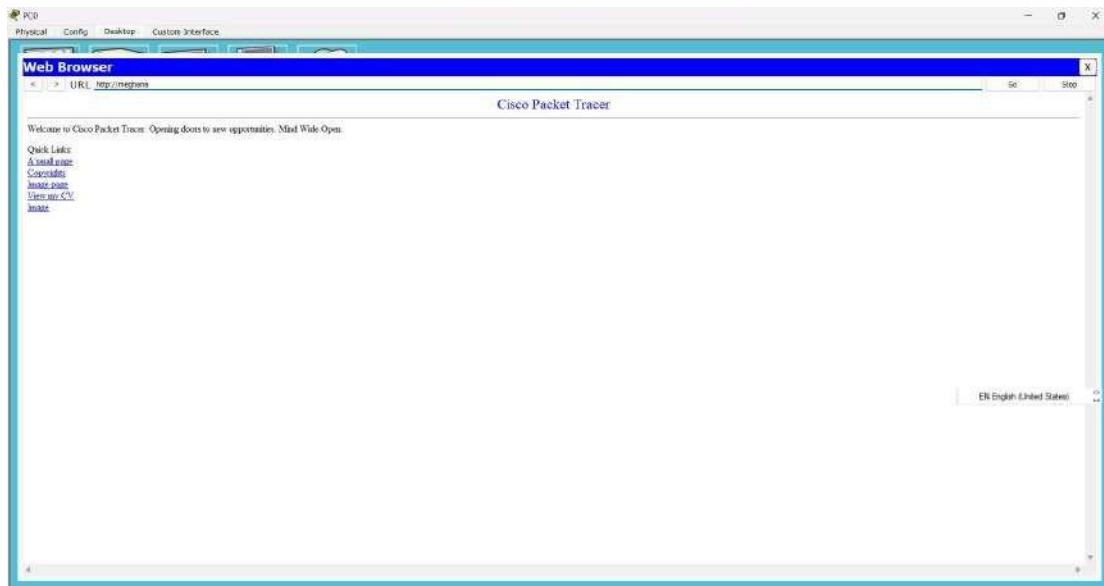

Fig 3: Web Browser of Pco

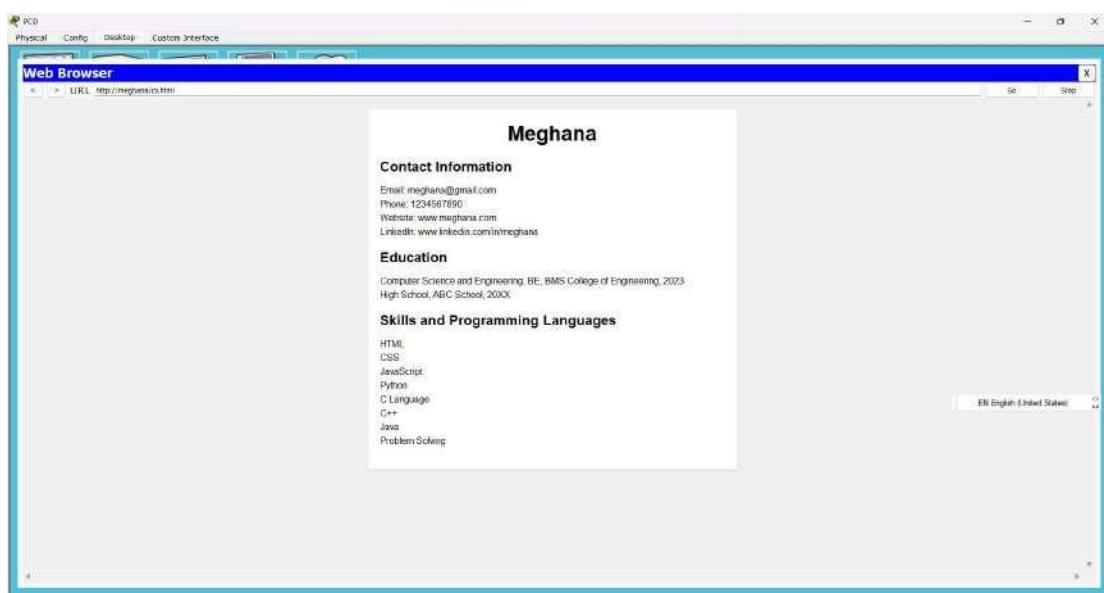

Fig 4: Newly added WebPage is being shown in Pco's Web Browser

# Experiment No. 7

## Cycle 1

### Aim-7

#### 7. Configure OSPF routing protocol

Topology:

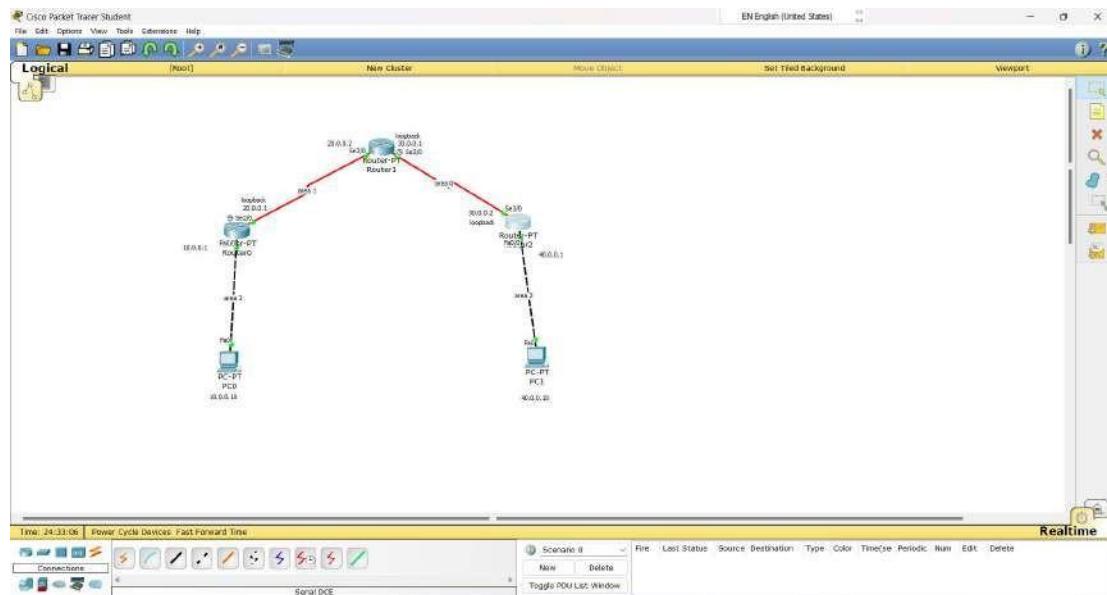

Fig 1: Topology

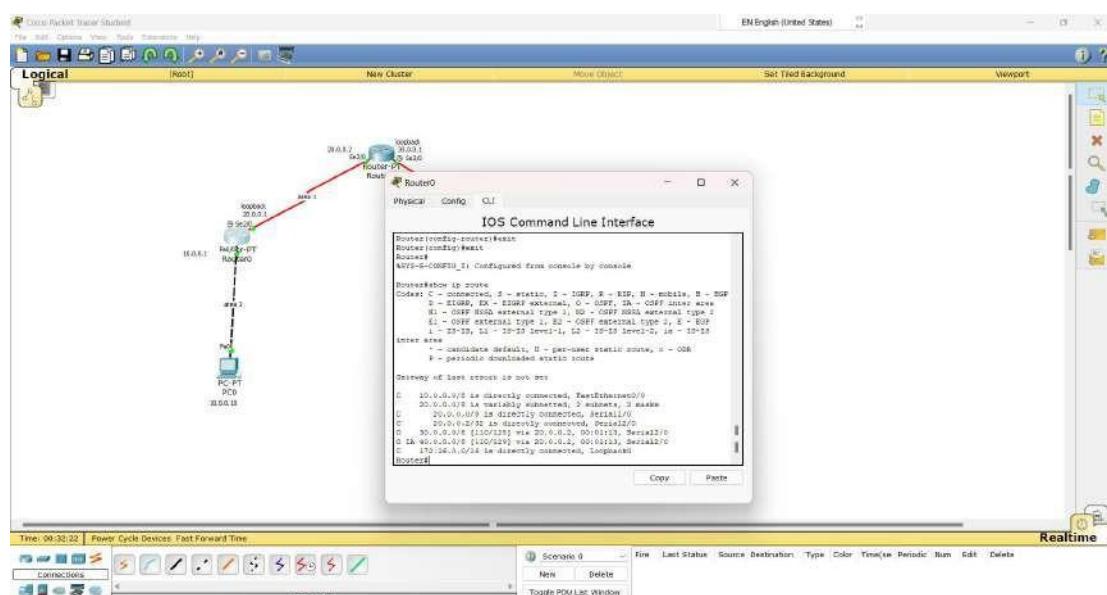

Fig 2: Routing table of Router 0

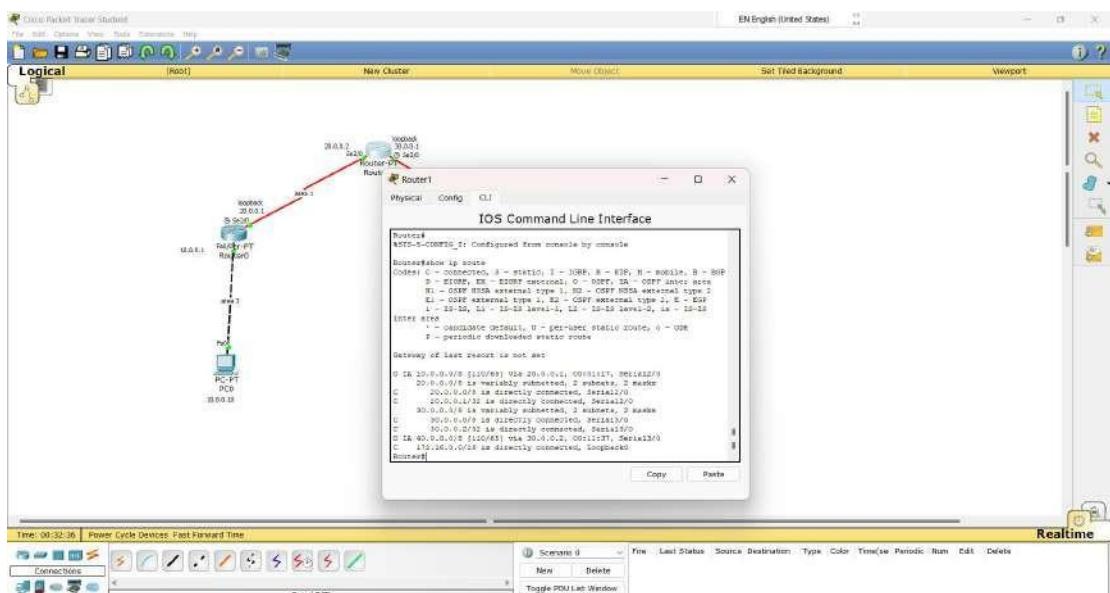

Fig 3: Routing table of Router 1

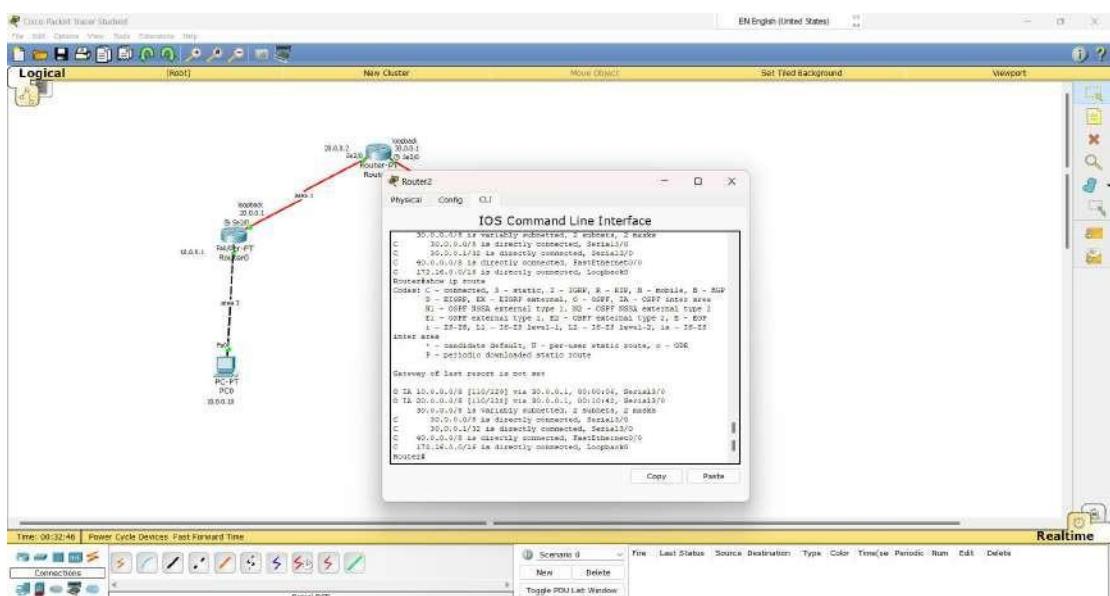

Fig 4: Routing table of Router 2

## Procedure and Observations:

Aim - 7

7. Configure OSPF routing Protocol.

Topology:

Procedure:

- ⇒ Configure PCs & the routers with IP address & default gateway according to the topology seen above.
- ⇒ Configure the routers as seen in the topology to be set as done in RIP routing protocol experiment.

→ Now enable ip routing by configuring OSPF routing protocol in all routers.

In Router R<sub>0</sub>

```
R0(config) # router OSPF 1  
R0(config-router) # router-id 1.1.1.1  
R0(config-router) # network 10.0.0.0 0.255.255.255 area 3  
R0(config-router) # network 20.0.0.0 0.255.255.255 area 1  
R0(config-router) # exit
```

In Router R<sub>1</sub>

```
R1(config) # router OSPF 1  
R1(config-router) # router-id 2.2.2.2  
R1(config-router) # network 20.0.0.0 0.255.255.255 area 1  
R1(config-router) # network 30.0.0.0 0.255.255.255 area 0  
R1(config-router) # exit area 0
```

In Router R<sub>2</sub>

```
R2(config) # router OSPF 1  
R2(config-router) # router-id 3.3.3.3  
R2(config-router) # network 30.0.0.0 0.255.255.255 area 0
```

R<sub>2</sub> (config-router) # network 40.0.0.0 0.255.255.255  
area 2

R<sub>2</sub> (config-router) # exit

→ Now configuring the virtual interface  
(loopback)

In Router R<sub>0</sub>

```
Router # config t
router(config) # interface Serial 2/0
router(config-if) # interface loopback 0
router(config-if) # ip address 172.16.1.252
                           255.255.0.0
router(config-if) # no shut
```

In Router R<sub>1</sub>

```
router # config t
router(config) # interface Serial 3/0
router(config-if) # interface loopback 0
router(config-if) # ip address 172.16.1.253
                           255.255.0.0
router(config-if) # no shut
```

In Router R<sub>2</sub>

```
router # config t
router(config) # interface Serial 3/0
router(config-if) # interface loopback 0
```

```
route (config-if) # ip address 172.16.1.254  
                           255.255.0.0
```

```
route (config-if) # no shut
```

→ Create virtual link between R<sub>1</sub>, R<sub>2</sub> by this we create a virtual link to connect area3 to area0.

In Router R<sub>0</sub>

```
route # config t
```

```
route(config) # router OSPF 1
```

```
route(config-router) # area3 virtual-link 2.2.2.2
```

```
route(config-router) # exit
```

In Router R<sub>1</sub>

```
route # config t
```

```
route(config) # router OSPF 1
```

```
route(config-router) # area1 virtual-link 1.1.1.1
```

```
route(config-router) # exit
```

→ R<sub>1</sub> & R<sub>2</sub> get updates about Area3. Now, check routing table of R<sub>0</sub>.

Router

In Router R<sub>1</sub>

router(config)# exit

Router# show ip route

c 10.0.0.0/8 is directly Connected, Fastethernet 0/0

20.0.0.0/8 is directly Variesly Subnetted,

2 Subnets, 2 masks

c 20.0.0.0/8 is directly Connected, Serial 2/0

c 20.0.0.2/32 is directly Connected, Serial 2/0

0 30.0.0.0/8 (110/128) via 20.0.0.2, 00:01:13,

Serial 2/0  
0 IA 40.0.0.0/8 (110/129) via 20.0.0.2, 00:01:13,  
Serial 2/0

c 172.16.0.0/16 is directly connected,  
Loopback 0.

→ Now check routing Table of R<sub>2</sub> & R<sub>2</sub>.

In Router R<sub>2</sub>

router(config)# exit

router# show ip route

0 IA 10.0.0.0/8 (110/65) via 20.0.0.1, 00:01:17,  
Serial 2/0

20.0.0.0/8 is Variesly Subnetted,

2 Subnets, 2 masks

- c 20.0.0.0/8 is directly connected, Serial 2/0
- c 20.0.0.1/32 is directly connected, Serial 2/0
- 20.0.0.0/8 is Varily Subnetted, 2 Subn, 2 masks
- c 30.0.0.0/8 is directly connected, Serial 3/0
- c 30.0.0.2/32 is directly connected, Serial 3/0
- 0 IA 40.0.0.0/8 (110/65) Via 30.0.0.2, 00:11:37, Serial 3/0
- c 172.16.0.6/16 is directly connected, Loopback 0

In Router R,

router (config) # exit

router # show ip route

- 0 IA 10.0.0.0/8 (110/121) Via 30.0.0.1, 00:01:51, Serial 3/0
- 0 IA 20.0.0.0/8 (110/128) Via 30.0.0.1, 00:12:26, Serial 3/0

30.0.0.0/8 is Varily Subnetted, 2 Subn -ctg, 2 masks

- c 30.0.0.0/8 is directly connected, Serial 2/0
- c 30.0.0.1/32 is directly connected, Serial 2/0
- c 40.0.0.0/8 is directly connected, FastEthernet 0/0

c 172.16.0.0/16 is directly connected, Loopback0

→ Pinging from PC0 to PC1

→ Ping 40.0.0.10

Pinging 40.0.0.10 with 32 bytes of data:

Request timed out

Reply from 40.0.0.10: bytes=32 time=2ms  
TTL=125

Reply from 40.0.0.10: bytes=32 time=7ms  
TTL=125

Reply from 40.0.0.10: bytes=32 time=6ms  
TTL=125

Ping statistics for 40.0.0.10:

Packets: Sent=4, Received=3, Lost=1 (25% loss)

Approximate round trip times in milli-seconds:

Minimum = 2ms, Maximum = 7ms, Average = 5ms

→ Pinging from PC1 to PC0

→ Ping 10.0.0.10

Pinging 10.0.0.10 with 32 bytes of data:

10<sup>o</sup> Reply from 10.0.0.10: bytes = 32 Time = 2 ms  
TTL = 125

Reply from 10.0.0.10: bytes = 32 Time = 2 ms  
TTL = 125

Reply from 10.0.0.10: bytes = 32 Time = 26 ms  
TTL = 125

Reply from 10.0.0.10: bytes = 32 Time = 2 ms  
TTL = 125

Ping statistics for 10.0.0.10:

packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milliseconds

Minimum = 2 ms, Maximum = 26 ms, Average = 8 ms.

Observation:

-> OSPF (Open Shortest Path First)

-> It is an open standard routing protocol

-> Link State routing protocol

-> Algorithm used is "Dijkstra", to find shortest path.

See  
8/7/23

## Output:

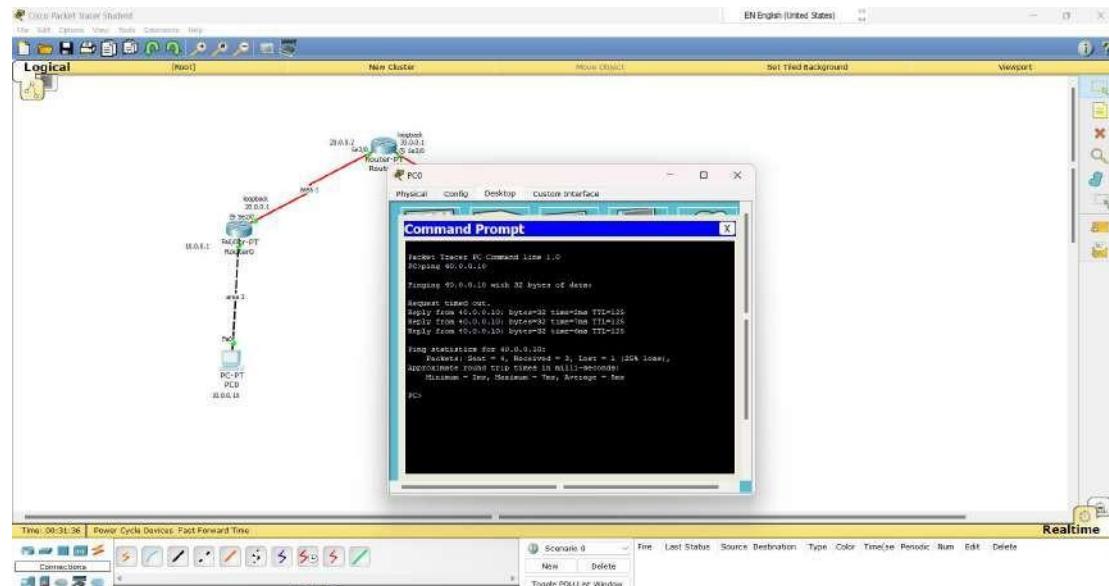

Fig 5: Pinging from PC0 to PC1

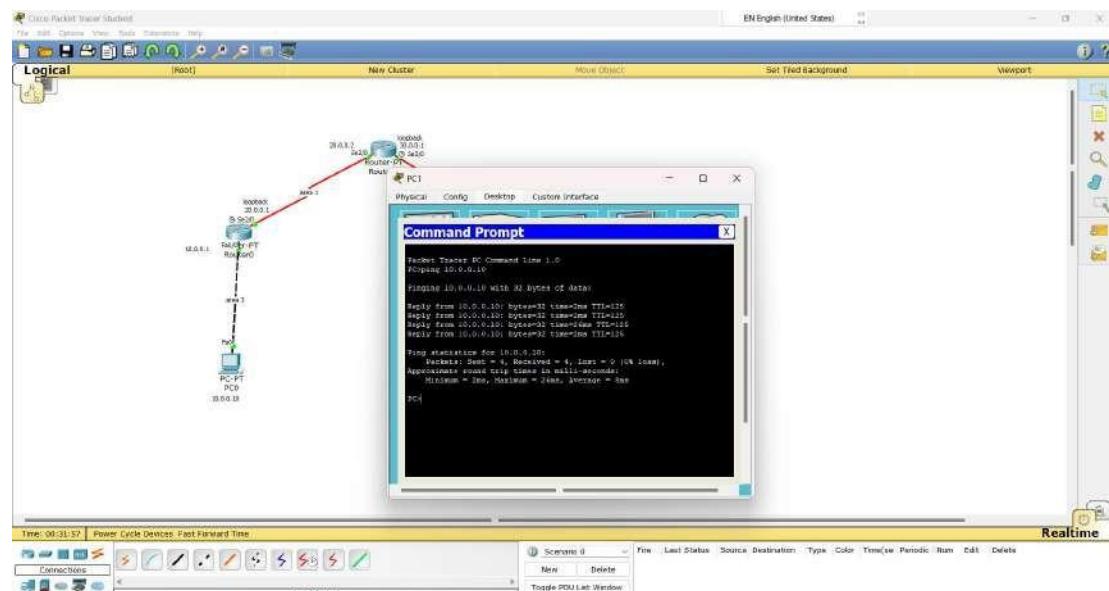

Fig 6: Pinging from PC1 to PC0

# Experiment No. 8

## Cycle 1

### Aim-8

8. To construct simple LAN and understand the concept and operation of Address Resolution Protocol (ARP).

**Topology:**

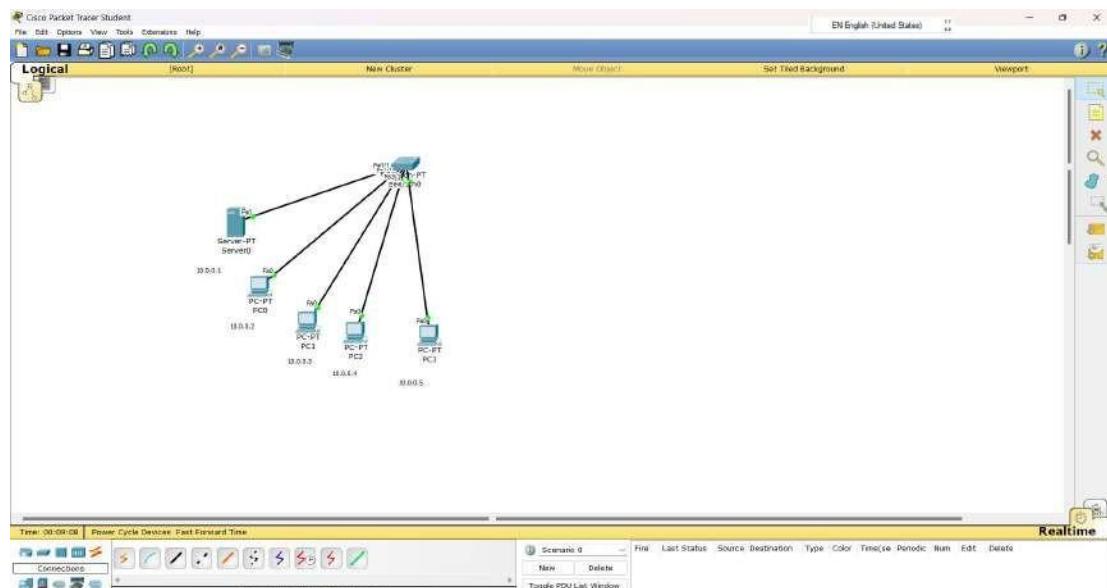

Fig 1: Topology

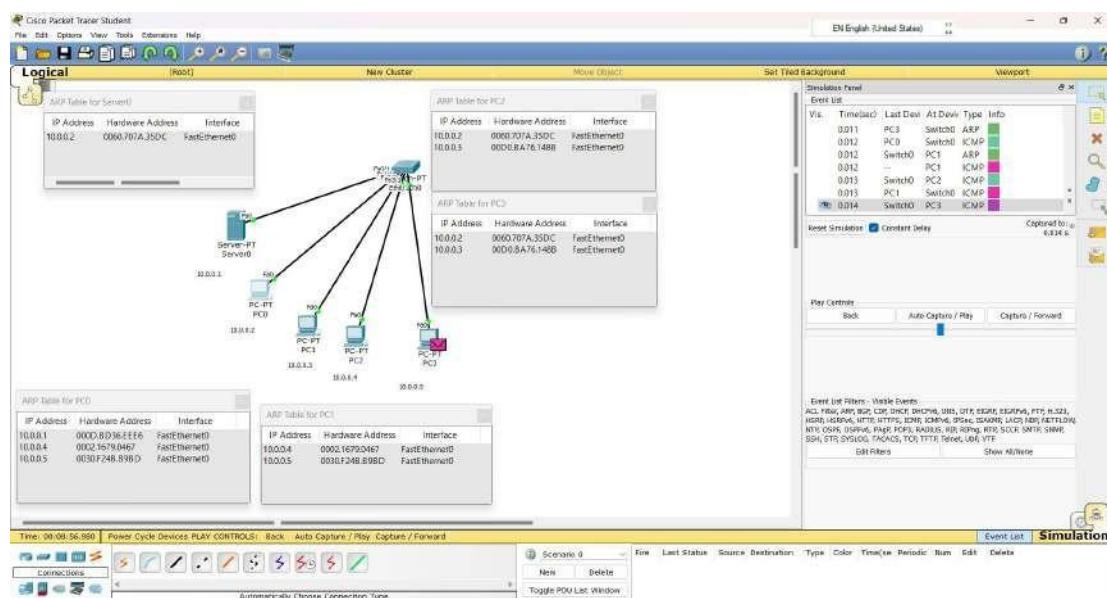

Fig 2: ARP tables of the devices connected in the topology

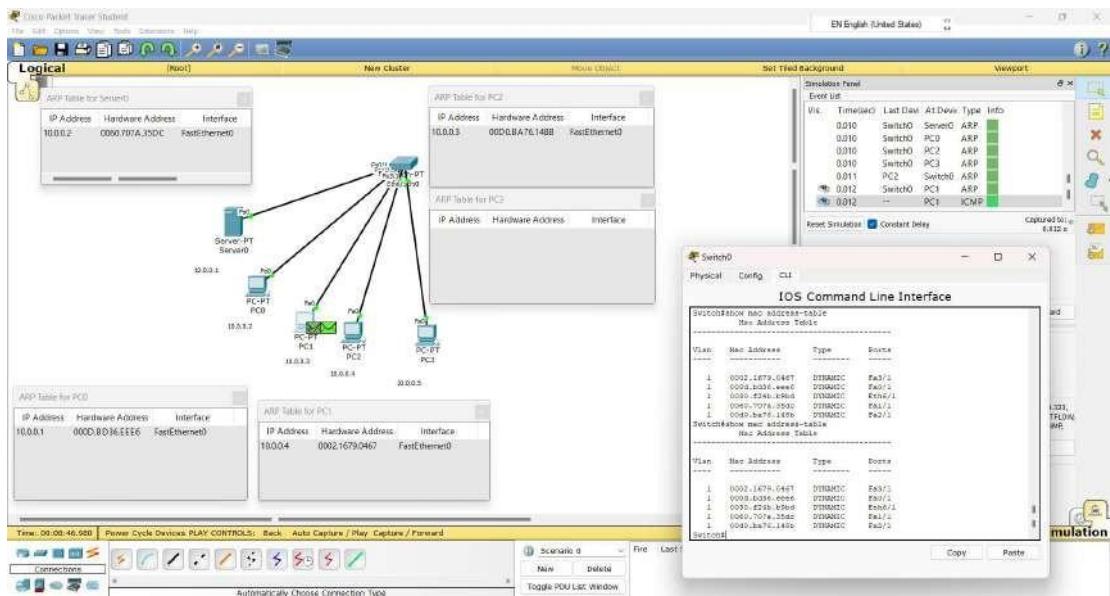

Fig 3: PDU packets are being sent/received with acknowledgement

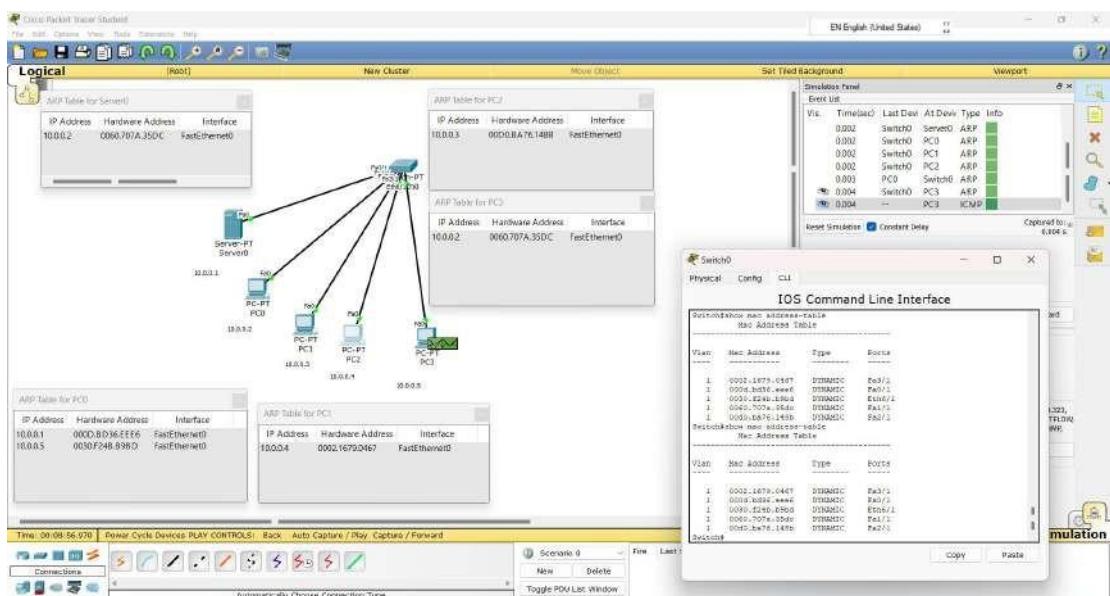

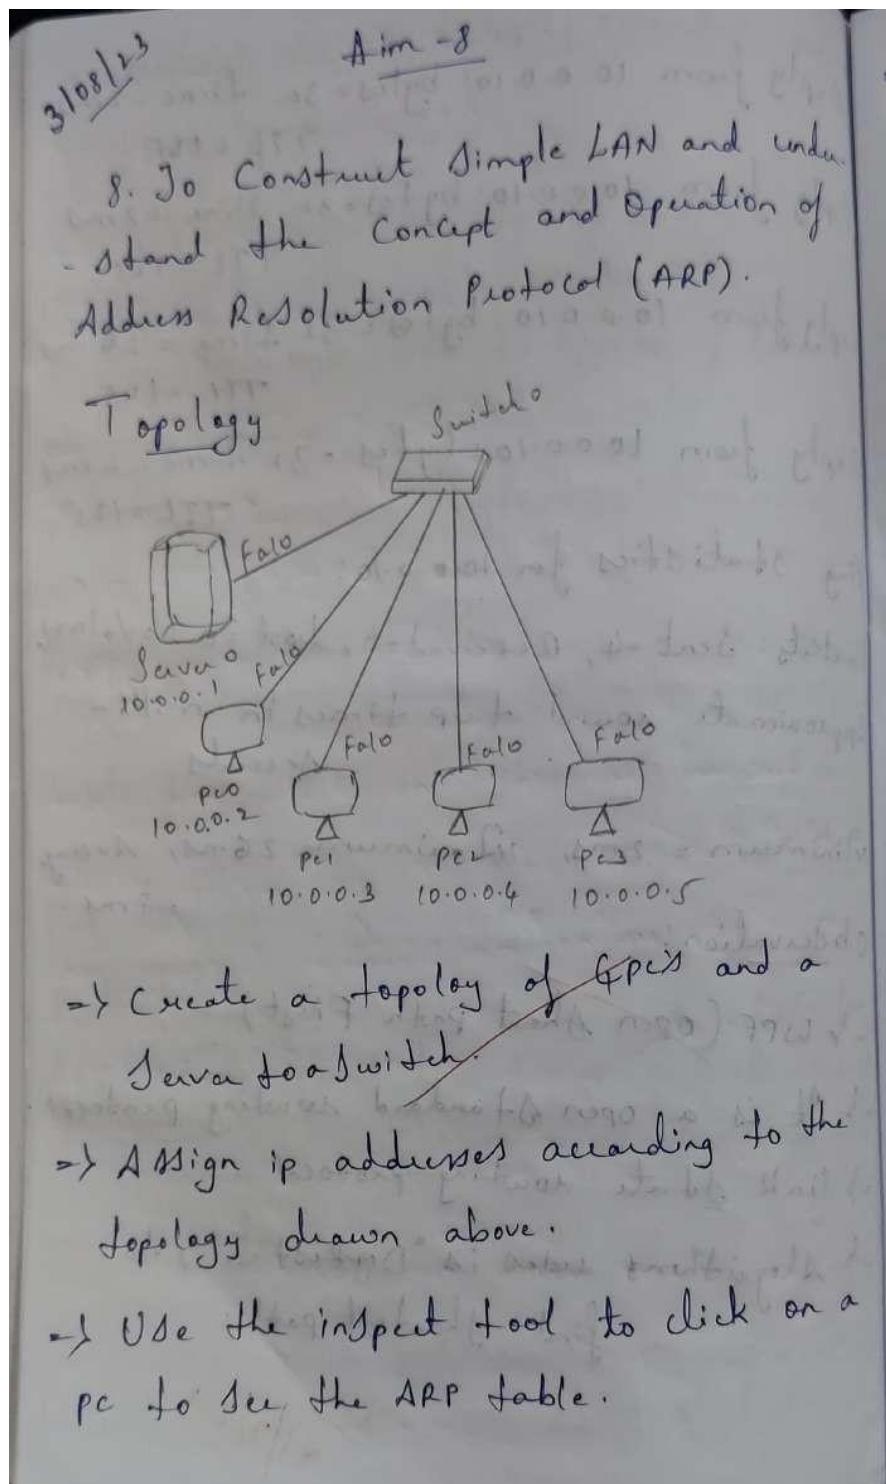

Fig 4: PDU packets are being sent/received with acknowledgement

**Procedure and Observation:**

- Command in PPTP CLI for the same is  
arp -a (this command is to be used  
in pc's command prompt which is situated  
in Desktop tab).
- When the "arp -a" command is used  
intially you will get a reply  
saying ARP Table is empty.
- Also in CLI of Switch, the command  
show mac address-table can be given  
on every transaction to see how the  
switch learns from transactions &  
build the address-table.
- Use the capture/forward button in  
the simulation panel to go step by  
step so that the changes in ARP can be  
clearly noted.

Outcome

Output observation

→ when ping message is passed from pco to Servo in simulation mode.

commands

\* (pco - Servo)

→ arp -a

No ARP Entries Found.

→ Ping 10.0.0.1

→ then click on capture/forward

→ After the message / ARP packets / packets are passed there's an entry made in Servo's ARP table

Servo's ARP table

"→ 10.0.0.2 0060.202A.35DC FastEthernet

→ then there's an entry made in pco's ARP table.

"→ 10.0.0.1 000D.BD36.EEE6 FastEthernet0

= & like wise the packets/messages

have been passed from. PC1 - PC2,

PC3 to PC0, PC2 - PC0 & PC1 - PC3.

& the entries in respective PCs ARP table will be made as switch learns their <sup>MAC</sup> addresses.

### Output

& now check the MAC address table in Switch

& check the MAC address table in Switch ~~when~~ after each transaction is being made.

Switch & enable

Switch # Show mac address-table

Mac Address Table

Wan	Mac Address	Type	Ports

Fig 8: Showing mac address-table for every transaction

# Experiment No. 9

## Cycle 1

### Aim-9

9. To construct a VLAN and make the PC's communicate among a VLAN

Topology:

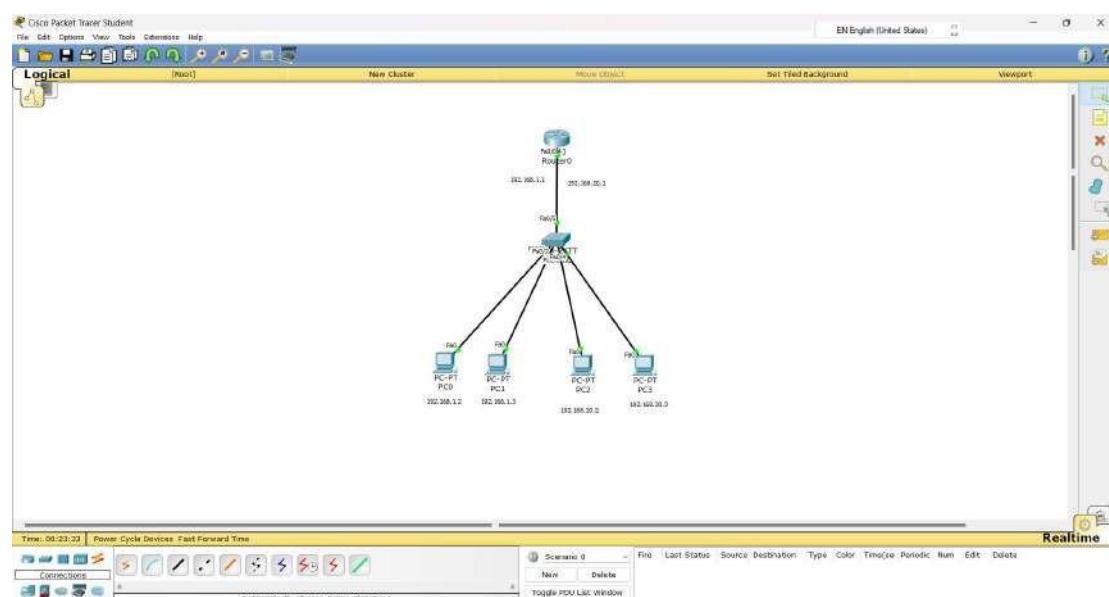

Fig 1: Topology

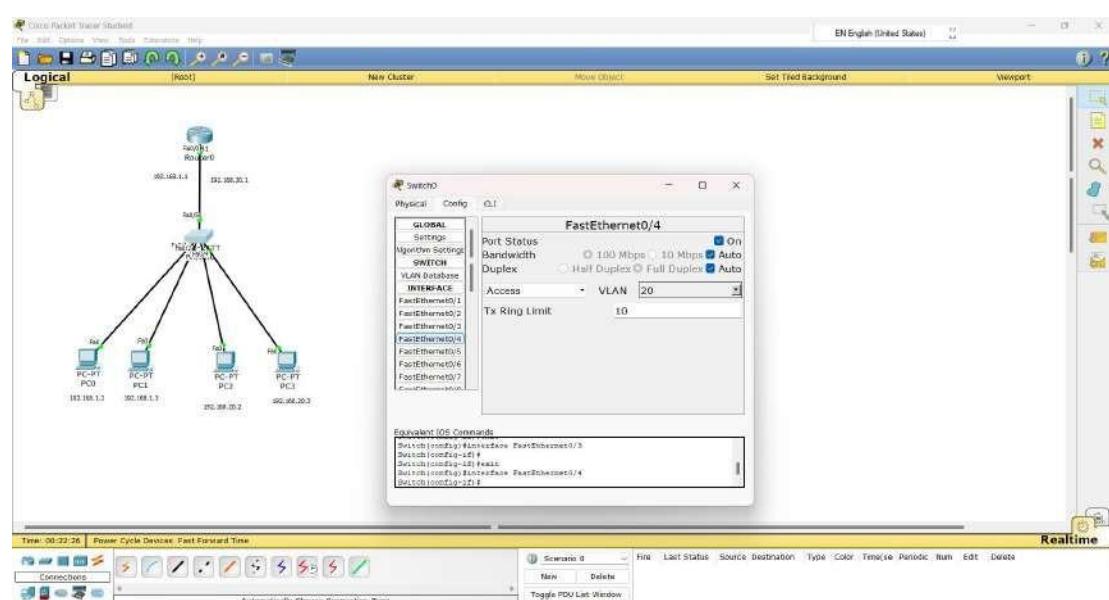

Fig 2: Fastethernet port configuration

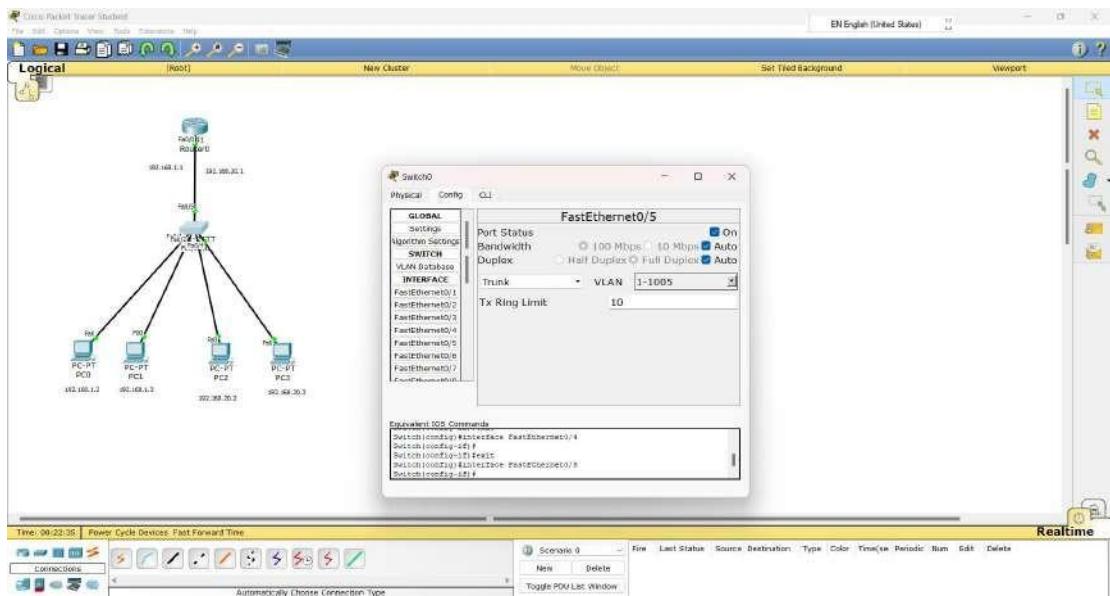

Fig 3: Port Configuration

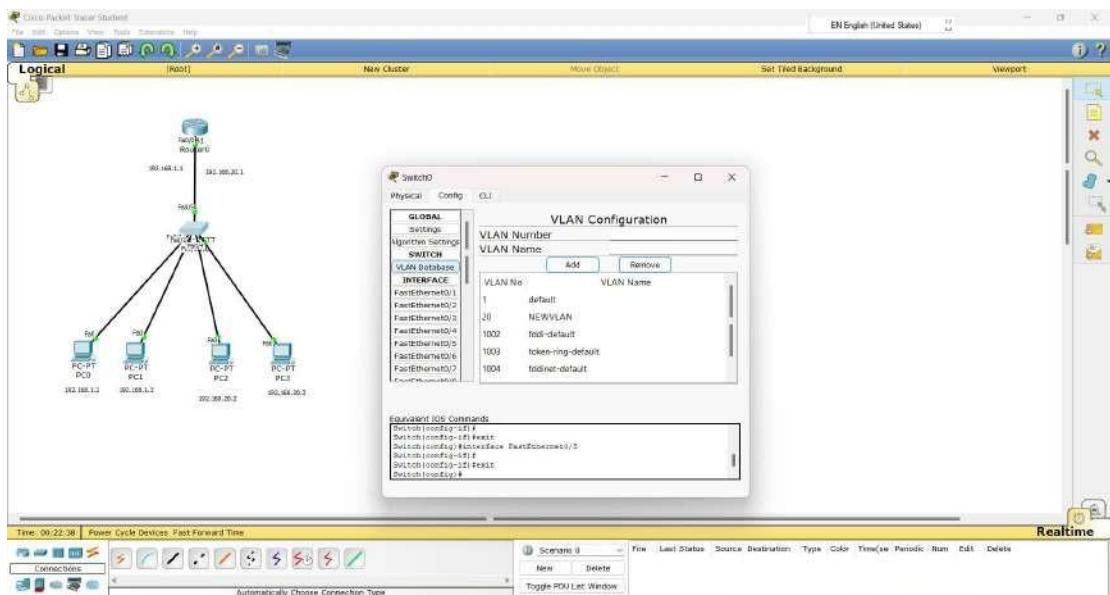

Fig 4: VLAN configuration

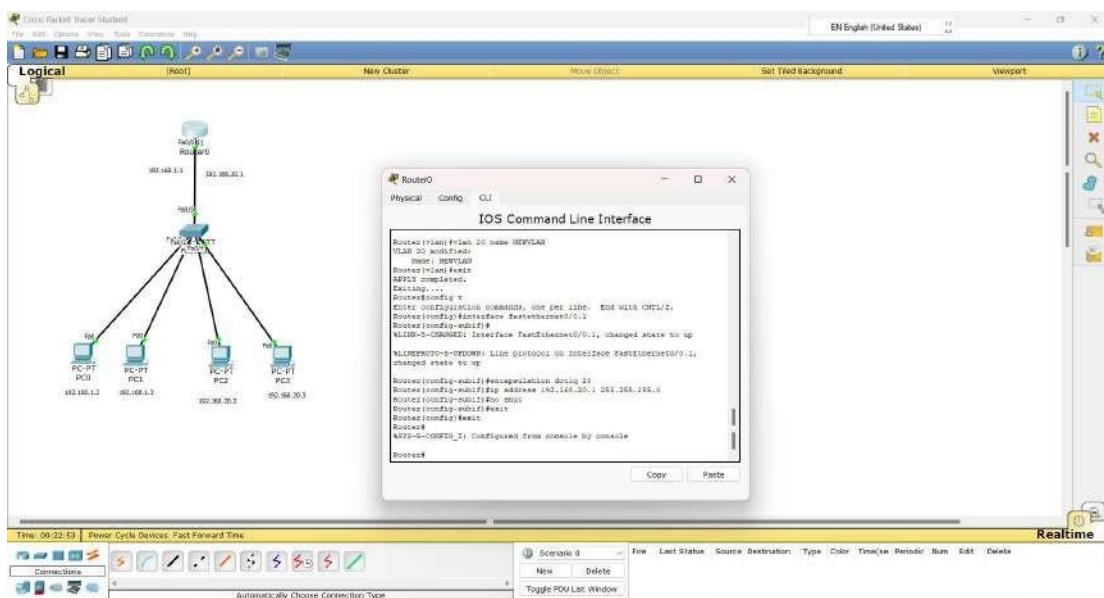

Fig 5: Virtual port configuration

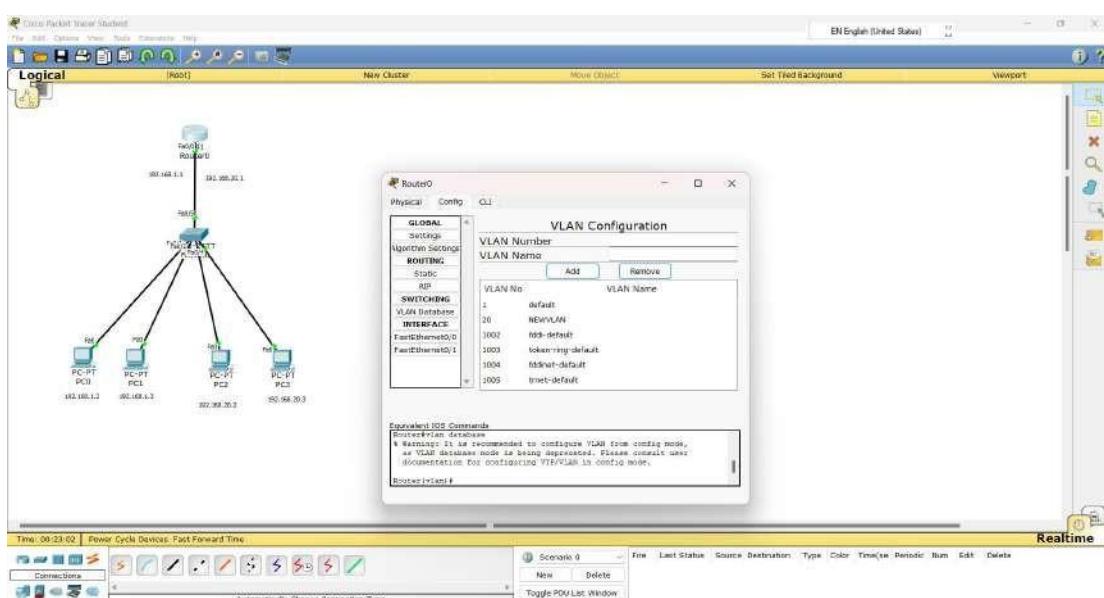

Fig 6: Newly created VLAN

## Procedure and Observation:

Aim - 9

6108123

9. To construct a VLAN and make the PCs communicate among a VLAN.

Topology:

Router  
Fa0/0: 192.168.1.1  
Fa0/1: 192.168.2.1

Switch  
Fa0/1  
Fa0/2  
Fa0/3  
Fa0/4  
Fa0/5

PC1: 192.168.1.2  
D.L.: 192.168.1.1

PC2: 192.168.2.2  
D.L.: 192.168.2.1

PC3: 192.168.2.3  
D.L.: 192.168.2.1

PC4: 192.168.1.3  
D.L.: 192.168.1.1

Procedure:

- Create a topology of one router (184), a switch and 4 PCs
- Assign the IP addresses of the PCs as shown above.

- Now only configure the interface which near router (i.e; Fa0/0) just assign the ip address & subnet mask (i.e; 192.168.1.1 and 255.0.0 255.255.255.0 respectively).
- In the switch, go to config tab and select VLAN Database.
  - In place of VLAN Number give "20" (any VLAN number can be given) and in place of VLAN Name give any name, i.e. for ex (NEWVLAN) and click on "Add".
  - Select the interface which near the switch from router (i.e; Fa0/5) in the switch's config tab.
  - Select "Trunk" by clicking on drop down (left side).
  - Select the interfaces which are near the switch from the PC i.e; Fa0/3 & Fa0/4 in the switch's config tab.
  - Click on VLAN drop down and select the other tick on the 20: NEWVLAN.

→ Now go to router's config tab

click on VLAN Database and enter the  
number and name of VLAN created  
i.e; here we gave (20, NEWVLAN).

→ Now goto router's CLI and give the  
below commands

Router(VLAN) # exit

Router # config t

Router(config) # interface fastethernet0/0.1

Router(config-subif) # encapsulation dot1q 20

Router(config-subif) # ip address 192.168.20.1  
255.255.255.0

Router(config-subif) # no shutdown

Router(config-subif) # exit

Router(config) # exit

## Output

→ Passing ping commands from pc0 to pc3  
and from pc3 to pc0.

"pc0 to pc3"

pc0 ping 192.168.20.3

Pinging 192.168.20.3 with 32 bytes of data:

Request timed out

Reply from 192.168.20.3: bytes=32 time=1ms  
TTL=127

Reply from 192.168.20.3: bytes=32 time=0ms  
TTL=127

Reply from 192.168.20.3: bytes=32 time=0ms  
TTL=127

Ping statistics for 192.168.20.3:

Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),

Approximate round trip times in milli-seconds:

Minimum = 0ms, Maximum = 1ms, Average  
= 0ms

Ans

"pcb to pco"

ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Reply from 192.168.1.2: bytes=32 time=0ms  
TTL=127

Reply from 192.168.1.2: bytes=32 time=0 ms  
TTL=127

Reply from 192.168.1.2: bytes=32 time=0 ms  
TTL=127

Reply from 192.168.1.2: bytes=32 time=0 ms  
TTL=127

Ping statistics for 192.168.1.2:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)

Approximate round trip times in milli-  
seconds,

Minimum = 0ms, Maximum = 1ms, Average =  
0ms

"pc1 to pc1"

pc1> ping 192.168.20.2

Pinging 192.168.20.2 with 32 bytes of  
data:

Request from timed out.

Reply from 192.168.20.2: bytes=32 time=  
1ms TTL=127

Reply from 192.168.20.2: bytes=32 time=  
0ms TTL=127

Reply from 192.168.20.2: bytes=32 time=  
0ms TTL=127

Ping Statistics for 192.168.20.2:

Packets: Sent=4, Received=3, Lost=1  
(25% loss),

Approximate round trip times in milli-  
seconds:

Minimum = 0ms, Maximum = 1ms, Average = 0ms

pc2 to pc1

pc> Ping 192.168.1.3

Pinging 192.168.1.3 with 32 bytes of data:

Reply from 192.168.1.3: bytes=32 time=0 ms  
TTL=127

Ping statistics for 192.168.1.3:

Packets: Sent = 4, Received = 4, Lost = 0  
(0% loss)

Approximate round trip times in milli-  
seconds:

Minimum = 0ms, Maximum = 0ms,

Average = 0ms.

observation:

↳ Virtual LAN (VLAN).

↳ Here we use a concept called VLAN

Tunking allows switches to forwards frames different VLANs over a single link called trunk.

↳ This is done by adding an additional header information called tag to the Ethernet frame. The process of adding this small header is called VLAN tagging.

See  
10/18/23

## Output:

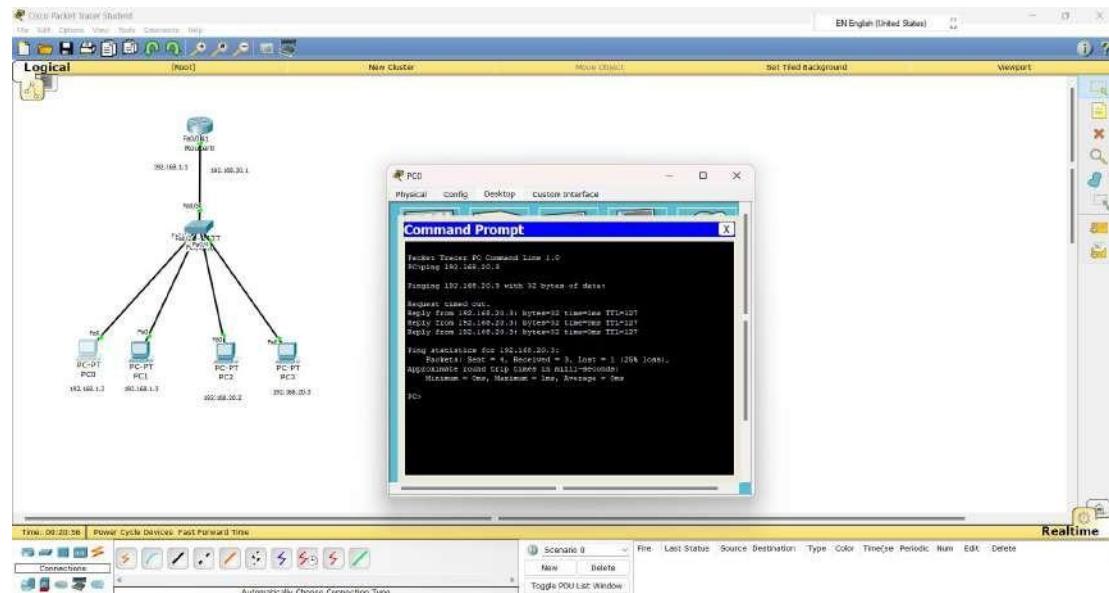

Fig 7: pinging from pc0 to pc3

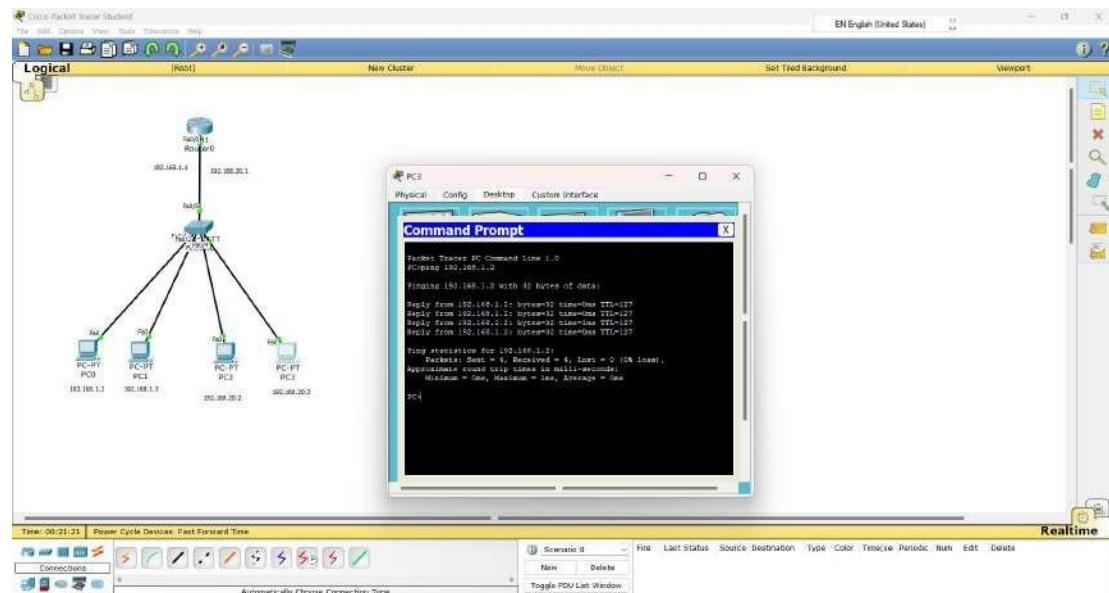

Fig 8: pinging from pc3 to pc0

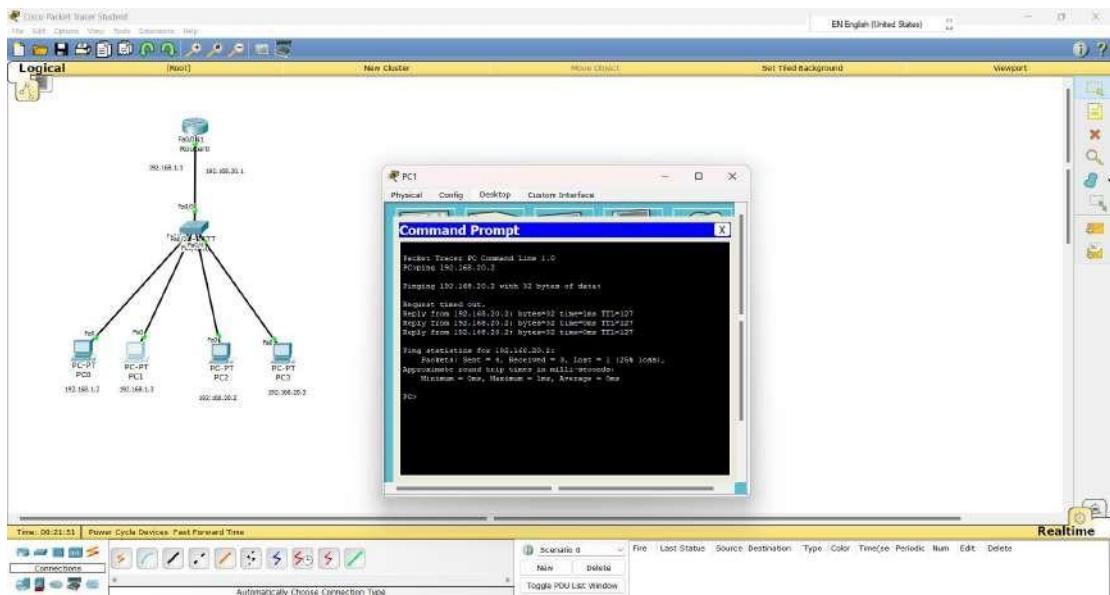

Fig 9: pinging from pc1 to pc2

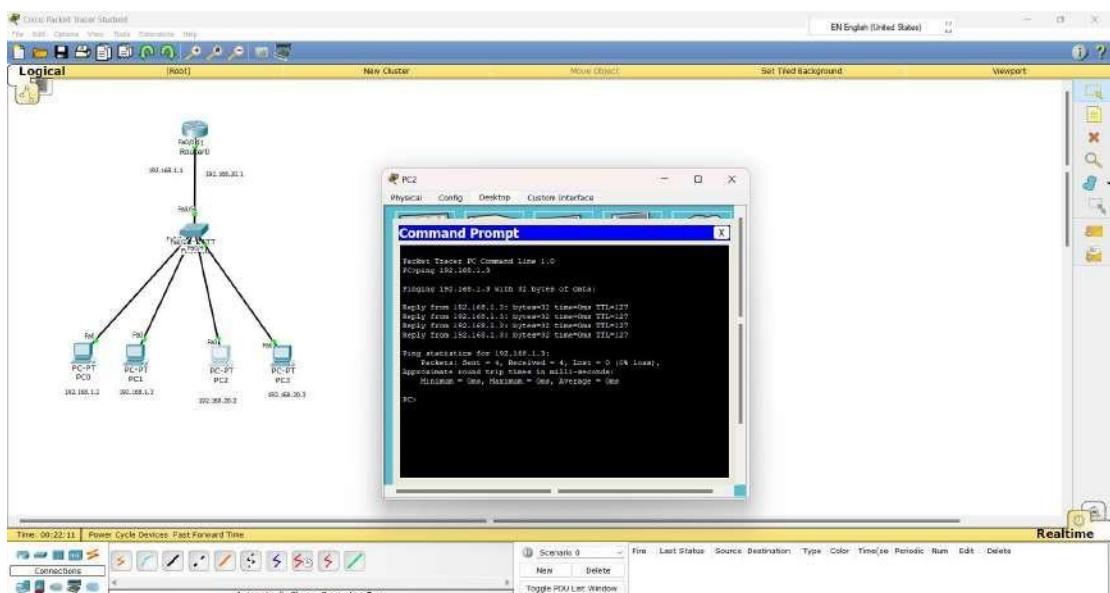

Fig 10: pinging from pc2 to pc1

# Experiment No. 10

## Cycle 1

### Aim-10

10. Demonstrate the TTL/ Life of a Packet

Topology:

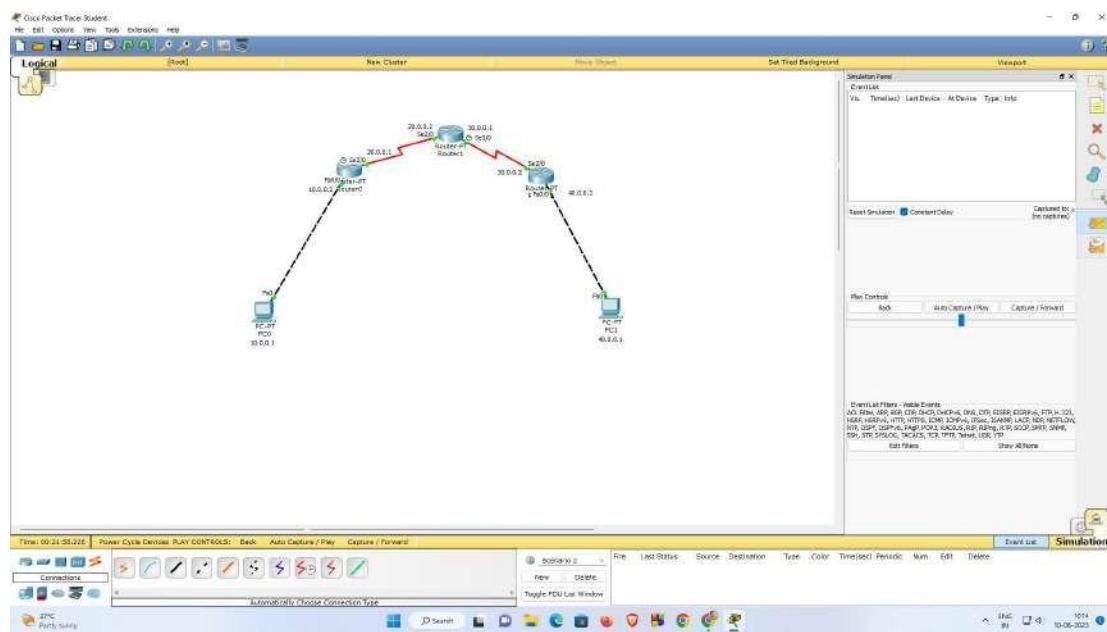

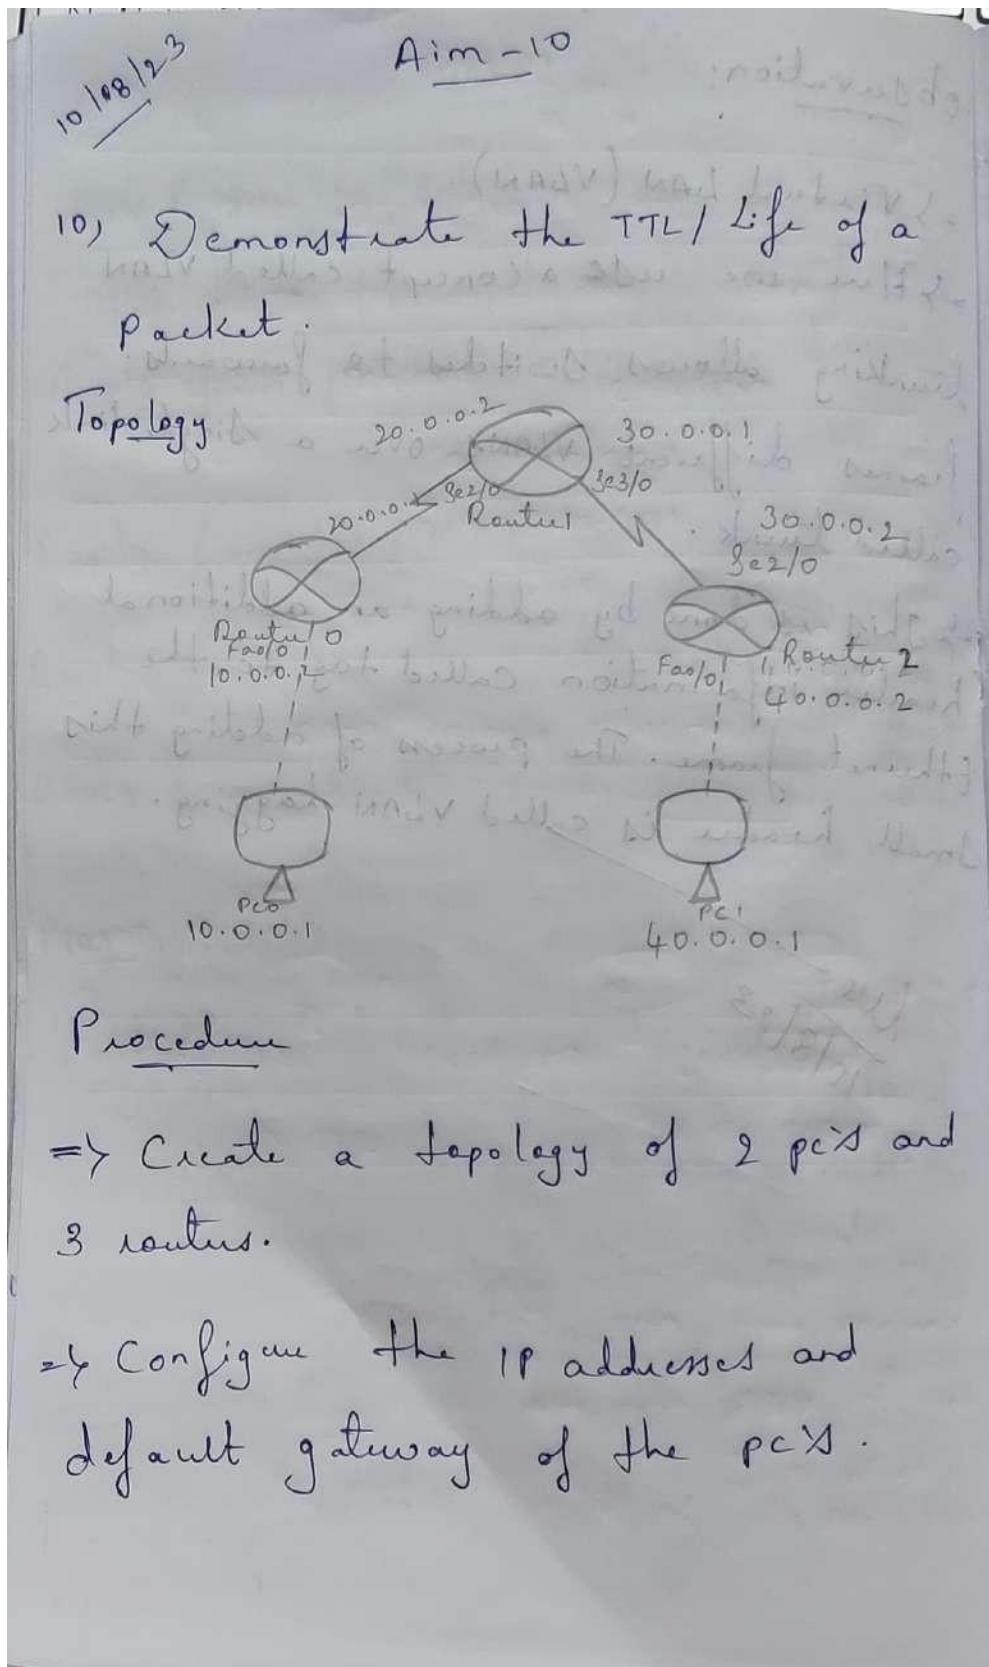

Fig 1: Topology

**Procedure and Observation:**

Procedure

=> Create a topology of 2 PCs and 3 routers.

=> Configure the IP addresses and default gateway of the PCs.

- Configure the devices as per static/default/dynamic routing.
- In the Simulation mode, send a simple PDU from one pc to another.
- Use capture button to capture every transfer.
- click on the PDU during every transfer to see the Inbound and Outbound PDU details observe that there is a difference of 1 in TTL when it crosses every route.

Output

- Initially when a packet (PDU) is sent from pc1 to pc0 (when it is at pc0 with the acknowledgement).

The PDU information at Device pc0

Ethernet II (header)	4	8	14	14	Bytes
PREAMBLE	101010...1011	DEST MAC:	000C:8586:DA04	SRC MAC:	000A:F3C3:77E4
TYPE: 0x800		DATA(VARIABLE LENGTH)		FCS 0x0	

IP				31 Bits
0	4	8	16 19	
4	IHL	DSCH: 0x0	TL: 28	
	ID: 0x1	0x0	0x0	
TTL: 255	PROT: 0x1	CHKSUM		
	SRC IP: 10.0.0.1			
	DST IP: 40.0.0.1			
	OPT: 0x0	0x0		
	DATA (VARIABLE LENGTH)			

0	8	16	31 Bits
TYPE: 0x8	CODE: 0x0	CHECKSUM	
ID: 0x2	SEQ NUMBER: 11		

$\Rightarrow$  when the PDU has been sent reached successfully PCI with the PDU information at Device PCI is as follows.

LST (WAKEUP) ATAC  
0x0

Ethernet II			Bytes
0	4	8	14
PREAMBLE 101010...1011	DEST MAC: 00E0.8FB1.B5D7	SRC MAC: 0002.157B.6EBC	
TYPE 0x800	DATA (VARIABLE LENGTH)	FCS: 0x0	

0	4	8	16	19	Bits
IP	IHL 4	DSCP: 0x0	TTL: 28		31
	ID: 0x2		0x0	0x0

	SRC IP: 40.0.0.1				
	DST IP: 10.0.0.1				
	OPT: 0x0		0x0		
	DATA (VARIABLE LENGTH)				

0	8	16	31 Bits
TYPE: 0x0	CODE: 0x0	CHECKSUM	
ID: 0x4		SEQ NUMBER: 3	

## Output:

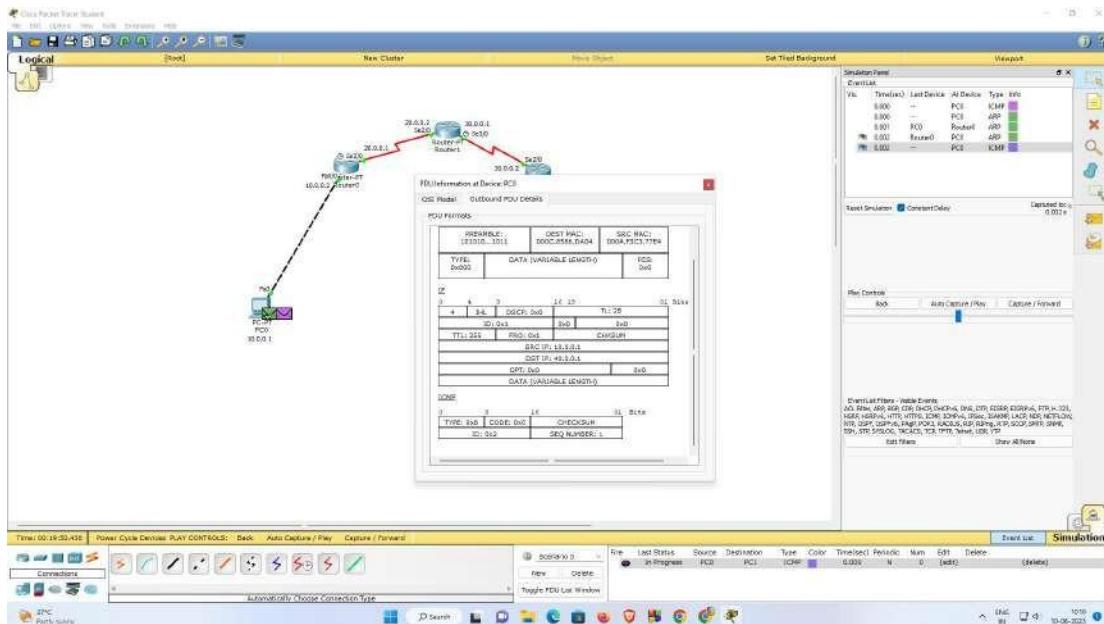

Fig 2: PDU information at device pco

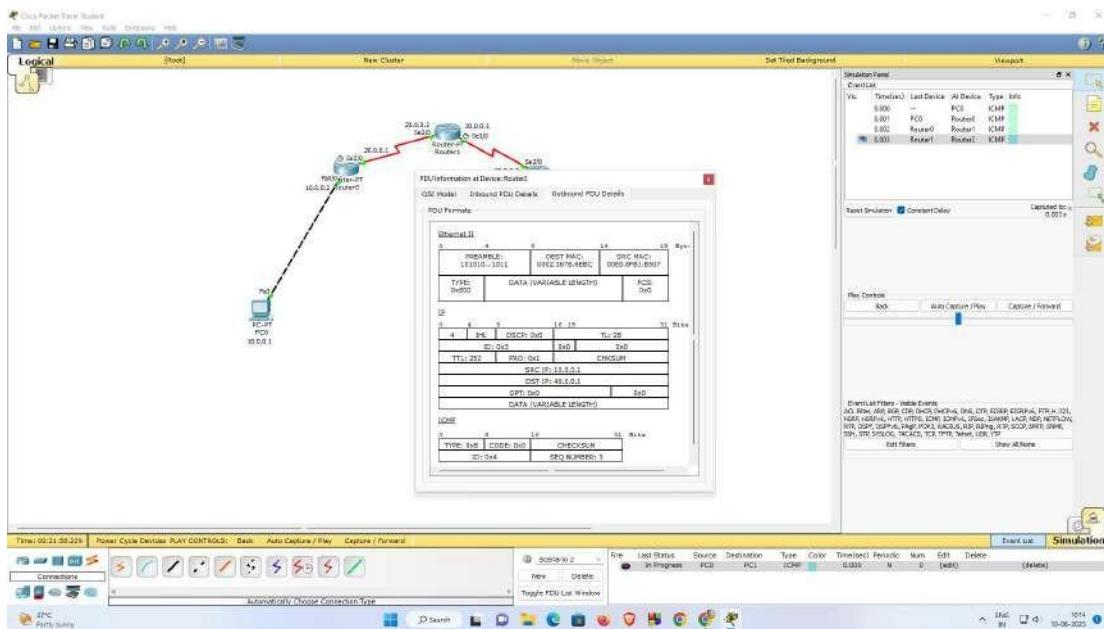

Fig 3: PDU information at device router2

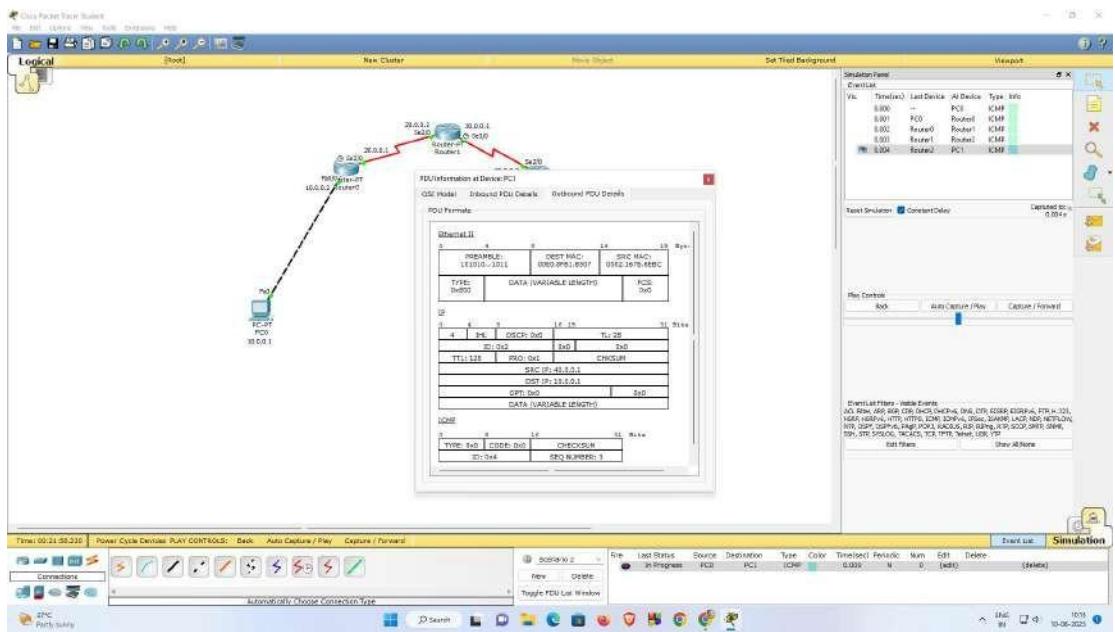

Fig 4: PDU information at device pc1

# Experiment No. 11

## Cycle 1

### Aim-11

11. To construct a WLAN and make the nodes communicate wirelessly

Topology:

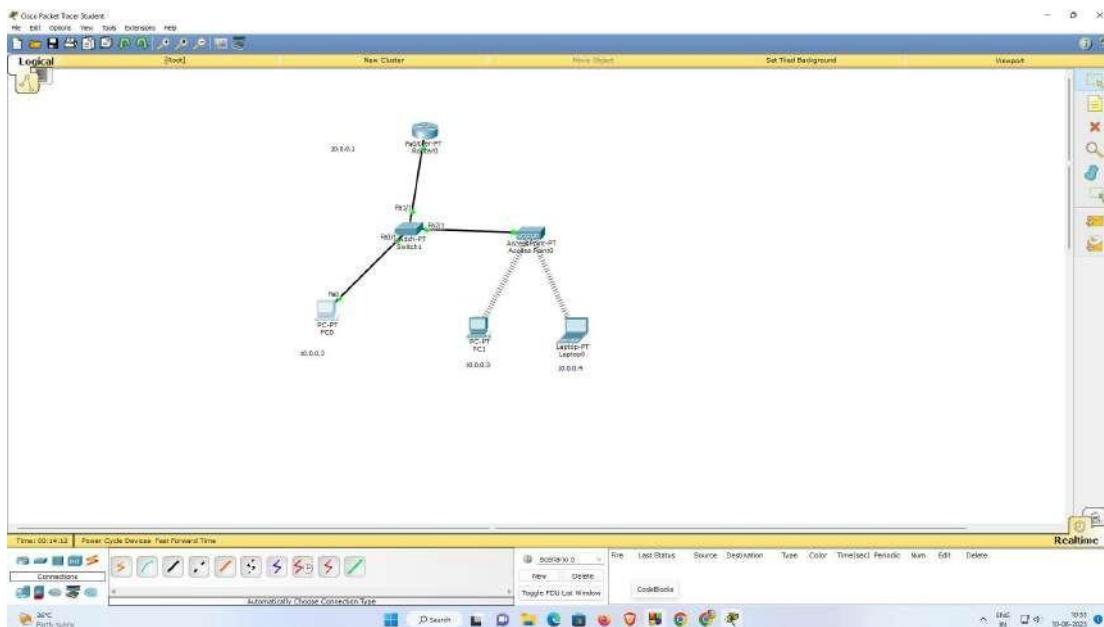

Fig 1: Topology

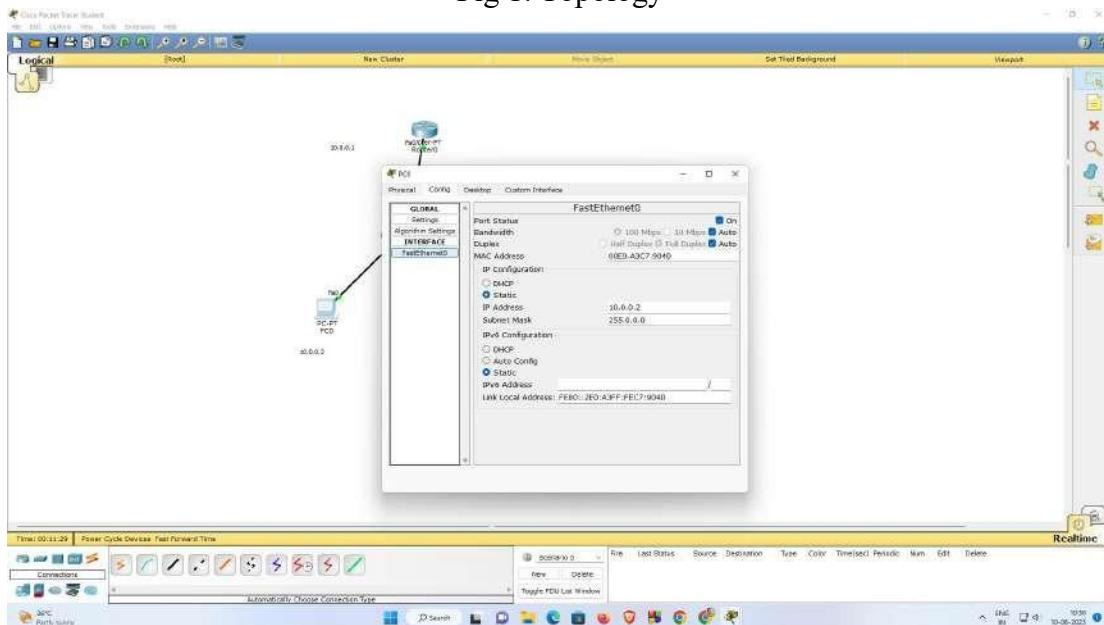

Fig 2: Pco configuration

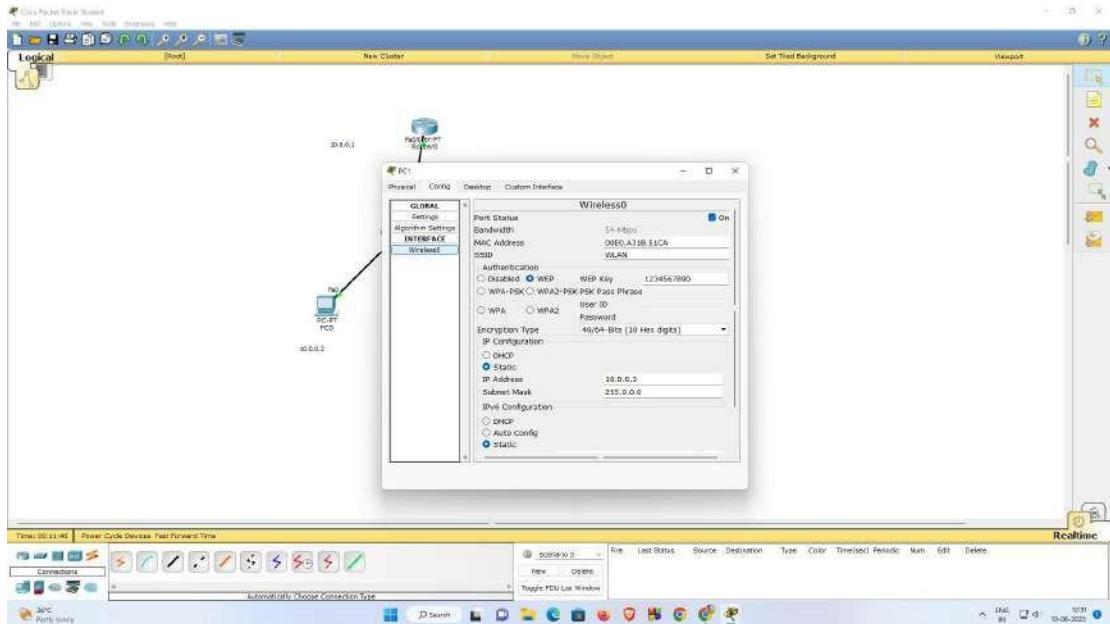

Fig 3: Pc1 configuration

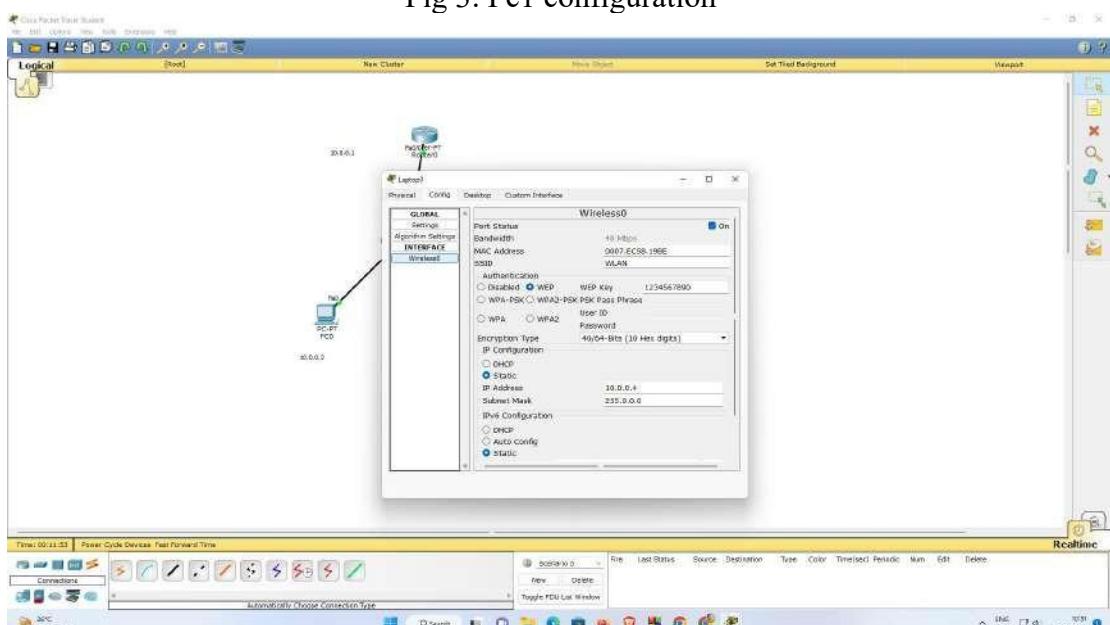

Fig 4: Laptop0 Configuration

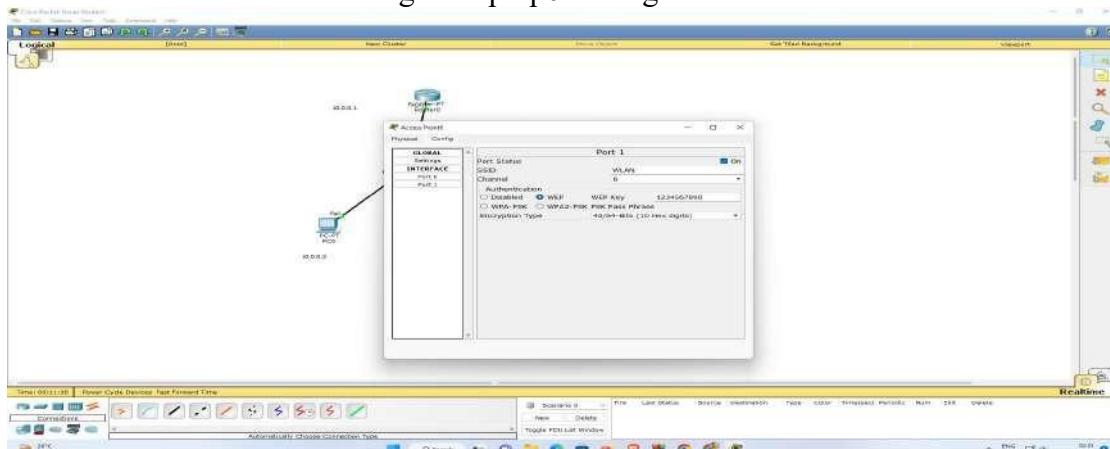

Fig 4: Access point0 Configuration

## Procedure and Observation:

Aim-11

11. To construct a WLAN and make the nodes communicate wirelessly.

Topology

```

graph TD
    Router0[Router0  
10.0.0.1] --- fa0_1[fa0/1]
    Router0 --- fa0_2[fa0/2]
    fa0_1 --- Switch[Switch  
fa0/1]
    fa0_2 --- AP0[Access point 0]
    Switch --- PC0[PC0  
10.0.0.2]
    Switch --- fa0_1_AP0[fa0/1]
    fa0_1_AP0 --- Laptop[Laptop  
10.0.0.4]
    fa0_1_AP0 --- PC1[PC1  
10.0.0.3]
  
```

Procedure

- ⇒ Create a topology of a router 2 PCs and a laptop and a access point.
- ⇒ Configure PC1 and the Router0 as it normally done.

- Configure Access point 1 - point 1 → SSID Name
  - any name (for example WLAN).
- Select WEP and give any 10 digit hex key
  - (for example 1234567890).
- Configuring PC1 and laptop with wireless Standards.
- Switch off the device. Drag the existing PT-HOST-NM-1AM to the component listed in the LHS. Drag KMP300N wireless interface to the empty port. Switch on the device.
- In the config tab of both PC1 and laptop a new wireless interface would've been added. Now configure SSID, WEP, WEP Key, IP address and Gateway (as normally done) to the device.

### Output

→ Pinging from PC0 to PC1

PC1 Ping 10.0.0.3

Pinging 10.0.0.3 with 32 bytes of data:

Reply from 10.0.0.3: bytes=32 time=8ms TTL=128

Reply from 10.0.0.3: bytes=32 time=11ms TTL=128

Reply from 10.0.0.3: bytes=32 time=7ms TTL=128

Reply from 10.0.0.3: bytes=32 time=8ms TTL=128

Ping statistics for 10.0.0.3:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milliseconds:

Minimum = 7ms, Maximum = 11ms, Average = 8ms

→ Pinging from PCI to laptop

PCI Ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data

Reply from 10.0.0.4: bytes=32 time=9ms TTL=128

→ Reply from 10.0.0.4: bytes=32 time=11 ms  
TTL=128

Reply from 10.0.0.4: bytes=32 time=8 ms  
TTL=128

Reply from 10.0.0.4: bytes=32 time=6 ms  
TTL=128

Ping statistics for 10.0.0.4:

Packets: Sent=4, Received=4, Lost=0 (0% loss)

Approximate round trip times in milliseconds:

Minimum=6ms, Maximum=11ms, Average  
≈ 8ms.

Now pinging from laptop to pc1

pc1 Ping 10.0.0.3

Pinging 10.0.0.3 with 32 bytes of data:

Reply from 10.0.0.3: bytes=32 time=33 ms  
TTL=128

Reply from 10.0.0.3: bytes=32 time=21 ms TTL=128

Reply from 10.0.0.3 bytes=32 time=12 ms TTL=128

Reply from 10.0.0.3 bytes=32 time=12 ms TTL=128

Ping statistics for 10.0.0.3:

Packets: Sent=4, Received=4, Lost=0 (0% loss)

Approximate round trip times in milli-seconds:

Minimum = 12 ms, Maximum = 33 ms, Average  
= 19 ms

→ Pinging from laptop 0 to PC0

PC > Ping 10.0.0.2

Pinging 10.0.0.2 with 32 bytes of data:

Reply from 10.0.0.2: bytes=32 time=23 ms TTL=128

Reply from 10.0.0.2: bytes=32 time=9 ms TTL=128

Reply from 10.0.0.2: bytes=32 time=12 ms TTL=128

Reply from 10.0.0.2: bytes=32 time=14 ms TTL=128

for

Ping statistics for 10.0.0.2:

Packets: Sent=4, Received=4, Lost=0 (0% loss)

Approximate round trip times in milli-  
seconds:

Minimum = 9 ms, Maximum = 23 ms, Average  
 $\approx 14$  ms

Now pinging from PC1 to Laptop 4.

PC1 ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time=16ms TTL=128

Reply from 10.0.0.4: bytes=32 time=18ms TTL=128

Reply from 10.0.0.4: bytes=32 time=13ms TTL=128

Reply from 10.0.0.4: bytes=32 time=14ms TTL=128

Ping statistics for 10.0.0.4:

Packets: Sent=4, Received=4, Lost=0 (0% loss);

Approximate round trip times in milli-seconds:

Minimum = 13 ms, Maximum = 18 ms, Average = 15 ms

Now ping from PC1 to PC0

PC1 ping 10.0.0.2

Pinging from 10.0.0.2 with 32 bytes of data

Reply from 10.0.0.2: bytes=32 time=27ms  
TTL=128

Reply from 10.0.0.2: bytes=32 time=13 ms  
TTL=128

Reply from 10.0.0.2: bytes=32 time=8 ms  
TTL=128

Reply from 10.0.0.2: bytes=32 time=8 ms  
TTL=128

Ping statistics for 10.0.0.2:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milli-seconds:

Minimum = 0 ms, Maximum = 27 ms, Average =

15 ms.

Output

Using the concept of WLAN we've

Setup a wireless communication with

the help of access point device.

# Experiment No. 12

## Cycle 1

### Aim-12

12. To understand the operation of TELNET by accessing the router in server room from a PC in IT office.

Topology:

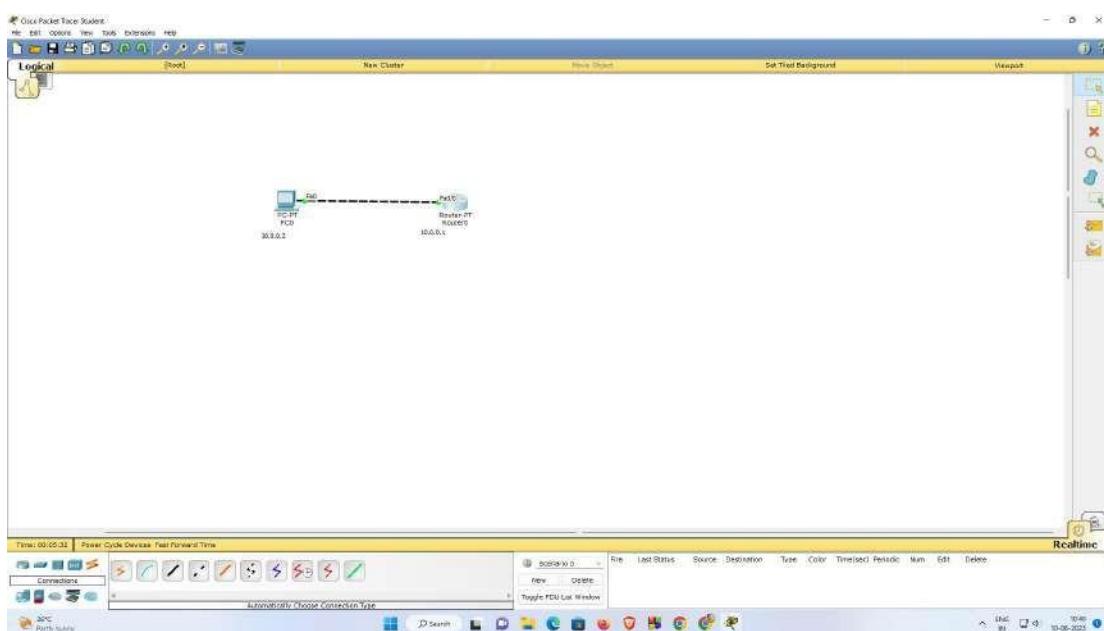

Fig 1: Topology

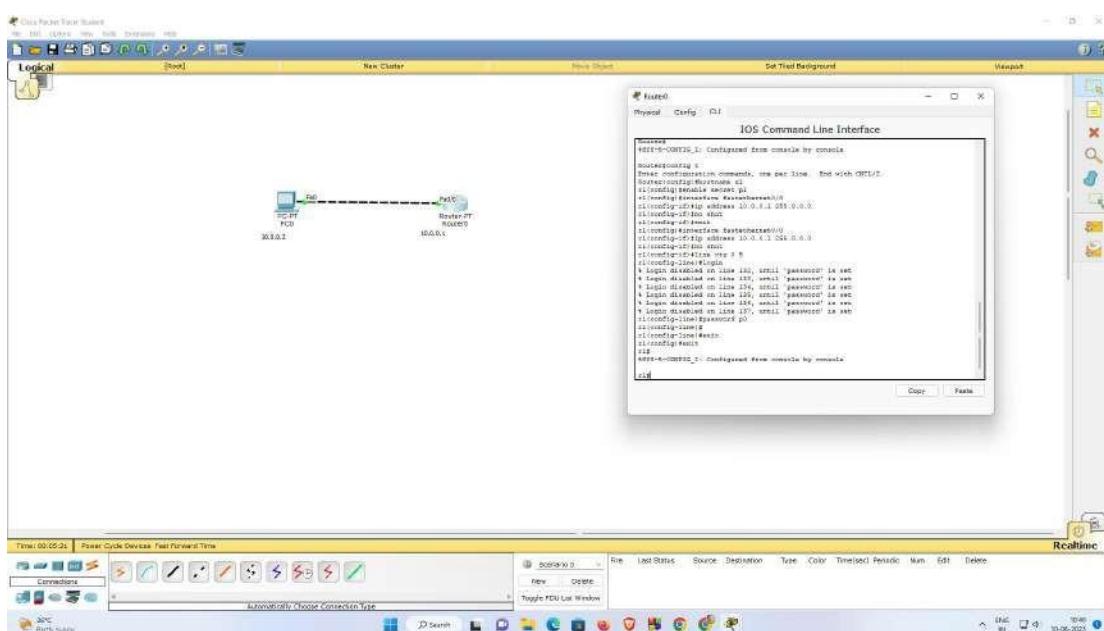

Fig 2: Router0 Configuration

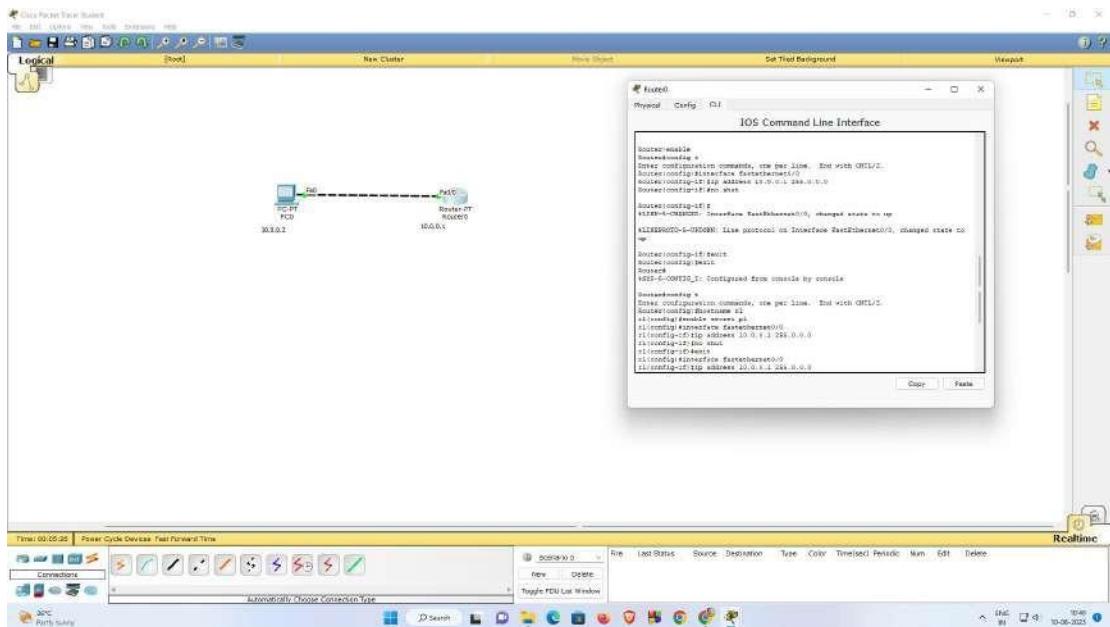

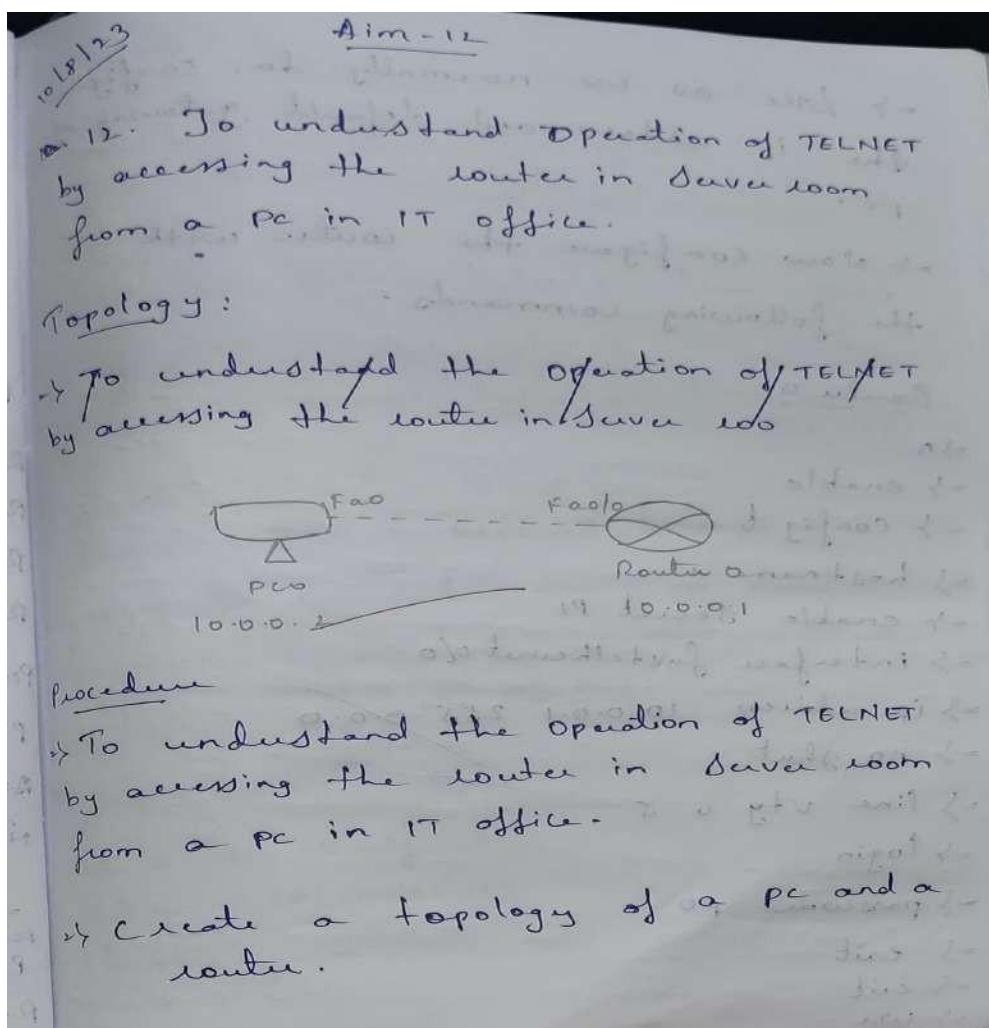

Fig 3: Router0 Configuration

### Procedure and Observation:

→ Like as we normally do, configure the ip address and default gateway of pc.

→ Now configure the router with the following commands.

Router 0

→ n

→ enable

→ config t

→ hostname R1

→ enable secret PI

→ interface fastethernet 0/0

→ ip address 10.0.0.1 255.0.0.0

→ no shut

→ line vty 0 5

→ login

→ password po

→ exit

→ exit

→ wr

Output

pinging from PC0 to router

ping 10.0.0.1

pinging 10.0.0.1 with 32 bytes of data:

pinging from 10.0.0.1: bytes=32 time=0ms

TTL=255

pinging from 10.0.0.1: bytes=32 time=0ms  
TTL=255

pinging from 10.0.0.1: bytes=32 time=0ms  
TTL=255

pinging from 10.0.0.1: bytes=32 time=0ms

## Experiment No. 13

Cycle 2

Aim-13

13. Write a program for error detecting code using CRCCCITT (16-bits).

Observation:

18/08/23      Cycle - 2      Aim - 1

1. Write a program for error detecting code using CRCCCITT (16-bits)

Code :

```
import java.util.*;
public class ecc {
    public static int n;
    public static void main(String[] args) {
        Scanner in = new Scanner(System.in);
        ecc ob=new ecc();
        String code, copy, rec, zero = "00000000000000";
        System.out.print("Enter poly: ");
        code = in.nextLine();
        System.out.println("Generating Polynomial:
                           1000100000100001");
        n = code.length();
        copy = code;
```

```

code += Zero;
System.out.println("Modified poly: " + code);
code = ob.divide(code);
System.out.println("checksum: " + code.substring(n));
copy = copy.substring(0, n) + code.substring(n);
System.out.println("Final Codeword: " + copy);
System.out.println("Just Error detection  
(Yes) 1 (no) 9 : ");
int choice = in.nextInt();
if (choice == -1) {
    System.out.print("Enter position on error: ");
    int errorPos = in.nextInt();
    if (copy.charAt(errorPos) == '1') {
        copy = copy.substring(0, errorPos) + "0" + copy.substring(errorPos + 1);
        copy = copy.substring(0, errorPos) + "1" + copy.substring(errorPos + 1);
    }
    System.out.println("Eroneous data: " + copy);
}

```

```

System.out.println("Even detected");
}
else
System.out.println("No even detected");
}

public String divide(String s) {
    int i, j;
    char x;
    String div = "10001000000100001";
    for (i=0; i<n; i++) {
        x = s.charAt(i);
        for (j=0; j<7; j++) {
            if (x == '1') {
                if (s.charAt(i+j) != div.charAt(j))
                    s = s.substring(0, i+j) + "1" + s.substring(i+j+1);
            }
            else {
                s = s.substring(0, i+j) + "0" + s.substring(i+j+1);
            }
        }
        return s;
    }
}

```

### Aim-15

15. Using TCP/IP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

Observation:

25/10/23  
Aim-3

3. Using TCP/IP Sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

code

```
ServerTCP.py
from socket import *
ServerName = "127.0.0.1"
ServerPort = 12000
ServerSocket = socket (AF_INET, SOCK_STREAM)
ServerSocket.bind ((ServerName, ServerPort))
ServerSocket.listen(1)
while True:
    print ("The Server is ready to receive")
    ConnectionSocket, addr = ServerSocket.accept()
    sentence = ConnectionSocket.recv(1024).decode()
```

```
file = open(sentence, "r")
l = file.read(1024)
connectionSocket.send(l.encode())
print('InSent: contents of ' + sentence)
file.close()
connectionSocket.close()

clientTCP.py
from socket import *
serverName = "127.0.0.1"
serverPort = 12000
clientSocket = socket(AF_INET, SOCK_STREAM)
clientSocket.connect((serverName, serverPort))
sentence = input("Enter file name: ")
clientSocket.send(sentence.encode())
filecontents = clientSocket.recv(1024).decode(),
print('From Server:\n')
print(filecontents)
clientSocket.close()
```

Code:

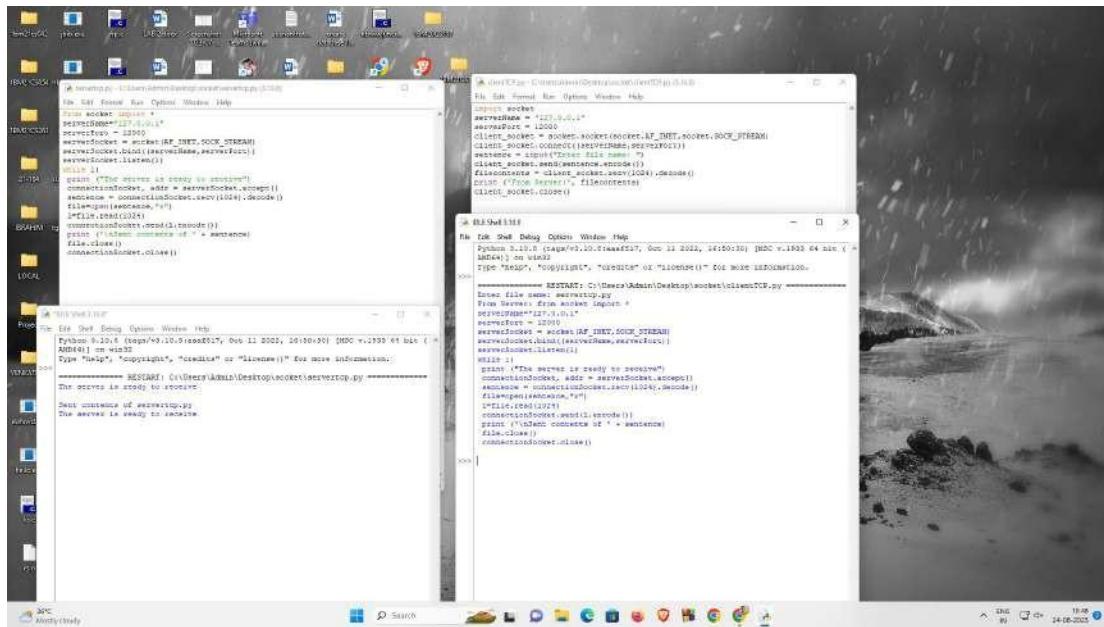

Server Tcp:

```
from socket import *
serverName="127.0.0.1"
serverPort = 12000
serverSocket = socket(AF_INET,SOCK_STREAM)
serverSocket.bind((serverName,serverPort))
serverSocket.listen(1)
while 1:
    print ("The server is ready to receive")
    connectionSocket, addr = serverSocket.accept()
    sentence = connectionSocket.recv(1024).decode()
    file=open(sentence,"r")
    l=file.read(1024)
    connectionSocket.send(l.encode())
    print ('\nSent contents of ' + sentence)
    file.close()
    connectionSocket.close()
```

Client Tcp:

```
from socket import *
serverName = '127.0.0.1'
serverPort = 12000
clientSocket = socket(AF_INET, SOCK_STREAM)
clientSocket.connect((serverName,serverPort))
sentence = input("\nEnter file name: ")
clientSocket.send(sentence.encode())
filecontents = clientSocket.recv(1024).decode()
print ('\nFrom Server:\n')
print(filecontents)
clientSocket.close()
```

## Output:

## Experiment No. 16

Cycle 2

### Aim-16

16. Using UDP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

Observation:

25/08/23      Aim-4

4. Using UDP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

Code

ServerUDP.py

```
from socket import *  
ServerPort = 12000  
ServerSocket = socket(AF_INET, SOCK_DGRAM)  
ServerSocket.bind(("127.0.0.1", ServerPort))  
print("The Server is ready to receive")  
while True:  
    sentence, clientAddress = ServerSocket.recvfrom(2048)  
    sentence = sentence.decode("utf-8")  
    file = open(sentence, "r")
```

```
con = file.read(2048)
serverSocket.sendto(bytes(con, "utf-8"),
                     clientAddress)

print("Insert contents of ", end = '')
print(sentence)
for i in sentence:
    print(stri(i), end = ' ')
file.close()
```

### client UDP . Py

```
from import
from socket import * 19/2023
ServerName = "127.0.0.1"
ServerPort = 12000
clientSocket = Socket(AF_INET, SOCK_DGRAM)
sentence = input("In Enter file name:")
clientSocket.sendto(bytes(sentence, "utf-8"),
                     (ServerName, ServerPort))

filecontents, serverAddress = clientSocket.recvfrom(2048)
```

```
print ('In Reply from Server:\n')
Print (filecontents.decode("utf-8"))
# for i in filecontents:
# print (str(i), end = '')
clientSocket.close()
```

### Output

## Experiment No. 17

Cycle 2

### Aim-17

#### 17. Wireshark Report

30/08/23  
Aim-s -  
Wireshark

→ Wireshark is a free to use application which is used to apprehend the data back and forth. It is often called as a free packet Sniffer computer application. It puts the network card into an unselective mode, i.e., to accept all the packets which it receives.

→ IP address = 10.124.8.126 (PC's IP address I -  
will write who is working on).

→ This filter is used to specify the IP address as the source or the destination address.

→ "tcp" command is used filter info which has TCP protocol.

→ "ipsec" command is used for the  
Source filter

→ "ipsec" is used for the destination  
filter.

→ In the packet list pane

Number (the number of the packet in  
capture file)

→ time -> the time stamp of the packet

→ Source -> the address where this  
packet is coming from

→ destination -> the address where this  
packet is going to

→ protocol ~ the protocol name in a short version.

length - the length of each packet

$\Rightarrow (\text{ip.sec} == \text{x}) \text{ and } (\text{ip.dst} == \text{y})$

This filter gives the info which has only mentioned ip. addresses.

-> ip. add! = ip address

if this filter shows you all traffic except  
the traffic to or from the specified  
computer.

=> icmp -> this filter will show you only  
icmp-traffic in the capture.
